Quality Policy

Industrial Motion Control, LLC designs and builds motion control components for integrators and users of automation equipment.

Our objective is to serve this industry by providing the **best value** in products and services to our customers.

To accomplish this, Industrial Motion Control, LLC is committed to **continual improvement** in our overall business performance.

Introduction

Industrial Motion Control, LLC (IMC), headquartered in Wheeling, IL USA, is a leading manufacturer of precision cam-actuated index drives, parts handlers, in-line conveyors and custom cams.

**IMC Headquarters
Wheeling, Illinois USA**

**European Headquarters (Ferguson S.A.)
Braine-le-Château, Belgium**

Formed by the merger of Commercial Cam Co. and Ferguson Machine Co., **IMC** offers the widest range of products in the industry. With over **100 years of experience** and significant investments in personnel and

capital equipment, IMC is unique in its ability to manufacture a full range of motion control products under the **Ferguson** and **Camco** brands.

Introduction

(continued)

IMC serves designers, builders and users of specialty automation equipment worldwide with manufacturing facilities in both North American and Europe. Sales offices are in North & South America, Asia and Europe.

Introduction

(continued)

IMC has a full staff of technically trained sales engineers and applications engineers to help select and specify the appropriate components for each specific machine design application. Proprietary software ensures that components are selected to meet the customers' requirements for accuracy, speed, load capacity and life expectancy.

Introduction

(continued)

Industrial Motion Control provides:

- ◆ **Quality.** Our manufacturing plants adhere to ISO-9001:2000 standards in all manufacturing and business functions. Our CNC milling and grinding equipment is state-of-the-art.
- ◆ **Value.** Through superior product design and investment in the best production equipment and facilities both in North America and Europe.

◆ **Service.** IMC provides application engineering assistance as well as in-field service and repair. Our delivery lead times are very competitive, supporting customers who demand short lead times to facilitate overall lead times for turnkey automation equipment projects. With sales and service facilities in various locations throughout the world, IMC can support your equipment wherever it is installed.

Engineering

CAMCO

FERGUSON

Foreword

Cam-actuated motion control is a specialized business. In a 4 to 5-year university curriculum for mechanical engineering, most students spend only a few weeks studying cams and their related mechanisms. In addition to continuing academic research, many advances in cam technology have been made by companies and employees involved in the commercial application of these products. This engineering section provides the basic concepts necessary for machine designers to wisely choose the best cam solutions for their application.

There are some good publications available to the general public for those seeking a more in-depth understanding of the subject. Three that we can

recommend are Clyde H. Moon's "Cam Design Manual for Engineers, Designers, and Draftsmen", published by Emerson Electric Co., Harold A. Rothbart's book, "Cam Design Handbook" published by McGraw-Hill and Robert L. Norton's book "Cam Design and Manufacturing Handbook" published by Industrial Press. Mr. Moon's book is available in Adobe Acrobat® PDF format on the IMC web site and can be easily downloaded at www.camcoindex.com.

We would like to thank all of the IMC employees and IMC manufacturer representatives that have contributed to our extensive cam knowledge base and helped collect the information presented in this catalog.

Introduction

Industrial Motion Control, LLC is a joint-venture company formed in 2001 between Ferguson Machine Co. and Commercial Cam Co., also known as Camco.

Ferguson has been in continuous operation since 1930, with European operations established in 1961. Camco was established in 1939, first manufacturing the copper coils required for the then-emerging residential and commercial air-conditioning and refrigeration industries. Camco needed cam-actuated machinery to produce these products and eventually the business focused on the commercialization of cam-operated machinery, index drives and custom cams.

As divisions of larger, Fortune 500 companies, both Ferguson and Camco were able to invest in substantial amounts of equipment and facilities while developing a diverse line of products that include **index drives, custom cams, parts handlers, precision-link conveyors and servo-motor drive systems**.

Today, as IMC, Ferguson and Camco are the world's largest producer of cam-actuated index drives, utilizing state-of-the-art production equipment to provide the highest quality cam-actuated and servo motor-actuated motion control products available.

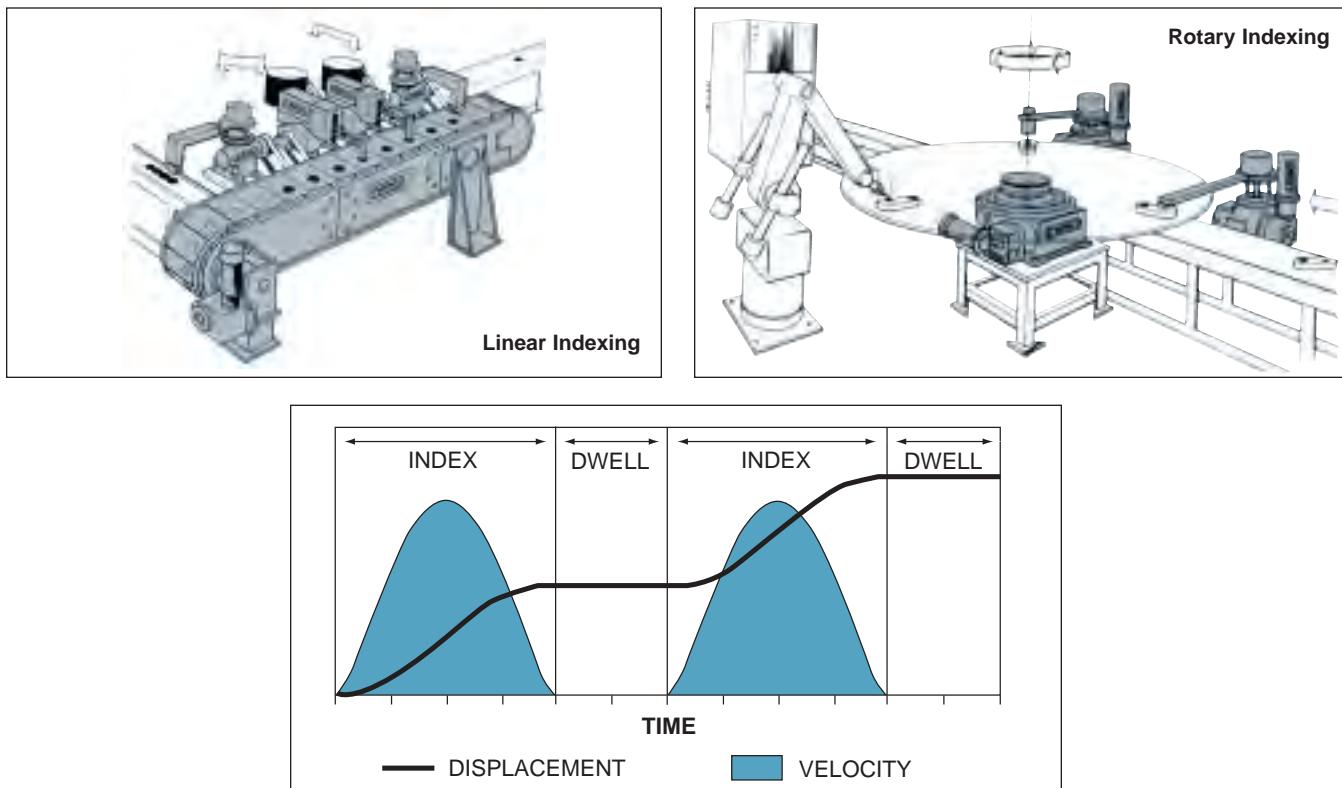

Solutions in Motion™

Choosing the proper type and size of index drive can be complicated. Over the years, IMC has developed a wealth of experience in selecting and applying the optimum product solutions to a wide variety of applications. IMC application engineers, sales engineers,

catalog information and proprietary software all combine to make the task less daunting. This engineering section will help eliminate much of the mystery behind high-performance indexing and its application in specialty machinery design.

What is Indexing?

Indexing can be linear or rotary. As defined by IMC, indexing is the process of starting and stopping in precise intervals at precise locations.

Why Cam-Actuated Index Drives?

The advantages of cam-controlled motion are obvious and effectively demonstrated in everyday life by the camshaft found in automobile engines. No other technology can provide comparable **speed, precision, repeatability, load capability and reliability**.

Cam-driven mechanisms require little or no maintenance and are capable of moving, with precision, a wide variety of products and components. For example – larger E-Series Index Drives rotate several tons of automotive body parts in seconds – and smaller P-Series and RG-Series index drives accurately index pharmaceutical components and electronic components in *milliseconds*. The mechanical technology typically requires no maintenance, other than routine checks for proper lubrication. Rolling pre-loaded contact between the cams and cam followers minimize wear and thermal inefficiencies. This preloading technique is also used on the input and output bearings of the index drive, achieving the most rigid, accurate and efficient mechanical actuator possible. With this inherent

rigidity, settling time (the time to dampen any vibrations) in dwell is short or virtually non-existent — very important for many applications requiring a combination of speed and precise positioning.

Through careful design of the cam profile, velocity and acceleration are also controlled throughout the indexing cycle, minimizing vibration and providing a known, repeatable displacement-time relationship.

In summary, cam-operated indexing systems have the following features and benefits:

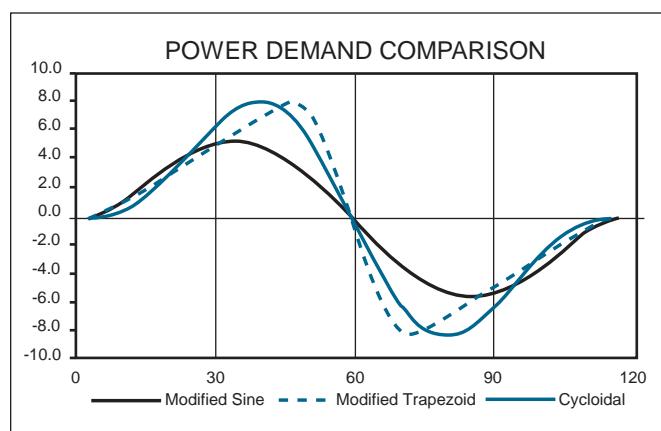

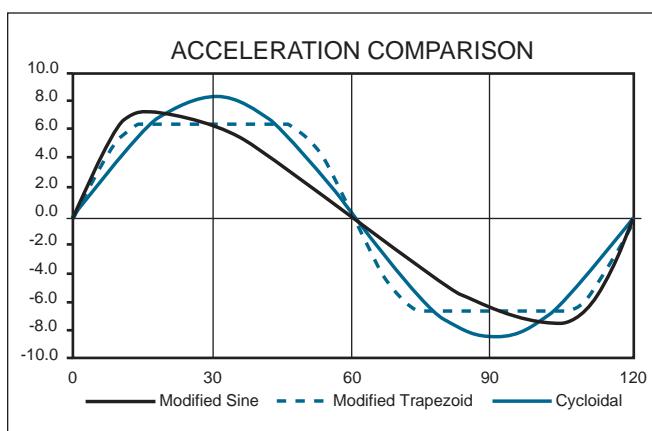

- ◆ Controlled Acceleration and Decelerations
- ◆ Repeatable, Accurate Positioning
- ◆ High Load Capacity
- ◆ High Speed Capability
- ◆ Smooth Motion
- ◆ Quick Settling Time in the Dwell Position
- ◆ Low Maintenance, Superior Life
- ◆ Known Displacement-Time Relationship
- ◆ Known Power Requirement

Types of Motions

Controlled Indexing is comprised of three sections or phases: **acceleration**, **peak velocity** and **deceleration**. To optimize the transition from one phase to the next, several standard motion profiles have been developed. They include **Cycloidal**, **Modified Sine** and **Modified Trapezoidal**. In special circumstances, the motion required calls out for certain positions and/or velocities at certain times in the index cycle. Special **Polynomial** curves can be constructed for these applications. In other applications, the peak velocity needs to match the velocity

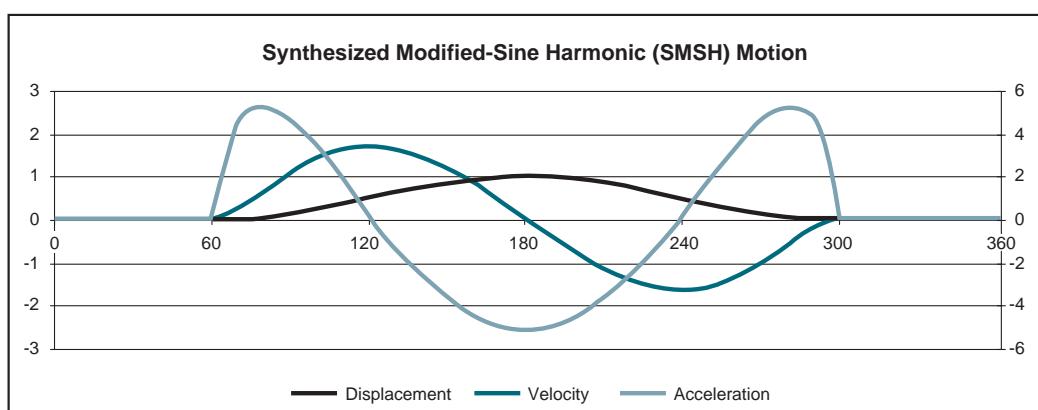

of another component of the machine – and variations of Polynomial and Modified Sine curves can be customized to suit the requirements.

IMC usually employs Modified Sine curves due to their smooth transition from peak acceleration to deceleration and smooth power demand curves. Frequently, a period of peak, constant velocity is needed due to cam design or machine design requirements and a variation of this motion curve, **Modified Sine Constant Velocity** (abbreviated "msc"), is used.

In addition to those motions already described, IMC also has several other special application motions. They include **Modified Sine Quick Return (MSQR)** and **Synthesized Modified Sine Harmonic (SMSH)**. **MSQR** is an oscillating motion with no dwells. It has a forward stroke with a matched peak velocity and a quick return stroke. It is used in applications where a constant speed conveyor or rotating dial is tracked (velocity is synchronized) in order to perform work

during the synchronized movement. Examples are printing or moving a saw or cutting blade to cut parts to size. **SMSH** is a motion used in oscillating applications that require a dwell at one end of the stroke and no dwell at the other. This motion reduces the number of acceleration reversals. Please contact your local IMC sales representative or IMC application engineer for further details.

Types of Index Drives

IMC manufactures all three types of index drive geometries: **Roller Gear, Right Angle, and Parallel**.

Roller Gear

This family of indexers uses a globoidal cam in conjunction with followers mounted radially outward from the circumference of the follower wheel, much like the teeth of a gear. The input shaft is

perpendicular to the output shaft. With this right angle configuration, it is possible to provide an optional large through-hole along the axis of the output shaft, or design a large output flange to accept dials (dial mounting). Large cam diameters relative to the output follower wheel allow for a wide range of special motions, short motion periods and a large output displacement for relatively smaller input displacement. In summary, **Roller Gear** Indexers provide:

- ◆ Compact Low Profile Design
- ◆ Flanged Output Capability for Dial Mounting Applications
- ◆ Through-Hole Capability (for electric and pneumatic lines or stationary center post)
- ◆ Motion Flexibility (special and complex motions) due to relatively large cam
- ◆ 2 to 24 Stop Range

Right Angle

This family of indexers uses a cylindrical or barrel cam in conjunction with followers mounted parallel to the axis of the output. Similar to the Roller Gear, the input shaft is perpendicular to the output shaft. The cam is tucked partially underneath the output wheel, offering a more compact arrangement. For a given torque requirement, Right Angle indexers usually occupy the least amount of floor space and volume. IMC production equipment allows us to produce very large index drives in this geometry. Control of the cam rib thickness allows for preloading. Center distances between input shaft and output shaft can be fixed accurately. The minimum cam rib requirements limit the range of motions (output motions as a function of

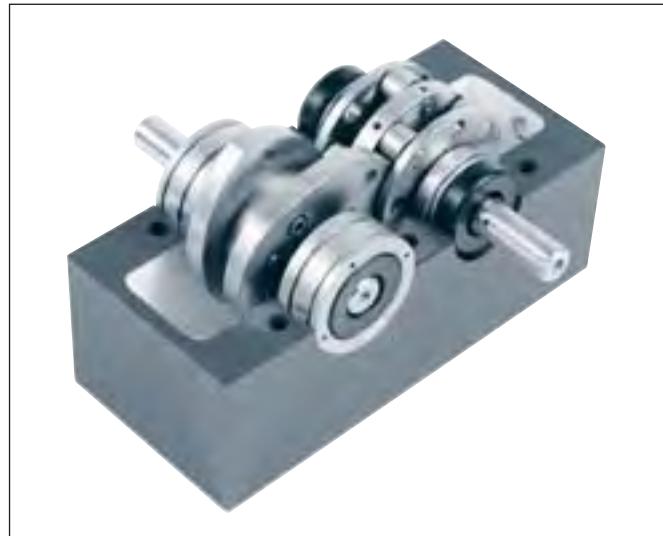

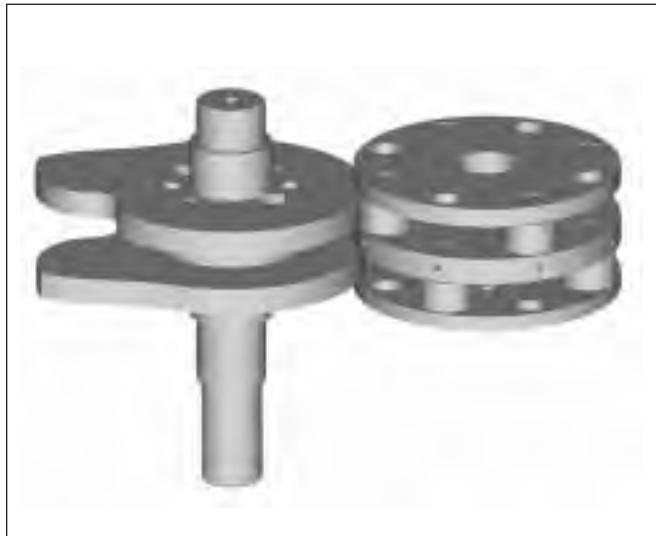

input motion) when compared to Roller Gear indexers. In summary, **Right Angle** Indexers provide:

- ◆ Most Compact Design for Given Output Capacity
- ◆ Fixed Center Distance Between Output and Input Shafts (tighter tolerance on the distance between input and output shafts)
- ◆ Flanged Output Capability for Dial Mounting Applications (E-Series & RAD Series)
- ◆ Through-Hole Capability (E-Series & RAD series)
- ◆ 3 to 24 Stop Range
- ◆ Very Large Index Drives for Automotive Assembly and Large (up to 40 feet) Dial Diameters

Types of Index Drives

(continued)

Parallel

This family of indexers use a pair of conjugate plate cams with yoke-mounted followers mounted parallel to the axis of the output. The input shaft is parallel to the output shaft. With this parallel configuration, there are no ribs on the cam as found on Roller Gear and Right Angle indexers. Also unique to the Parallel family is no reversal of the cam followers. Since they rotate in the same direction throughout the index cycle, index rates of over 1000 indexes per minute are possible. Without minimum rib requirements (no rib), larger followers can be used, providing high torque capability. Parallel indexers produce high output displacements for relatively smaller input

displacements. The yoke-mounted geometry also makes the Parallel family more resistant to shock loading (more robust). Double output shafts are also available. In summary, **Parallel** Indexers provide:

- ◆ High Speed Capability (with Non-Reversing Followers)
- ◆ High Load Capability (with Oversized Followers)
- ◆ Shock Resistance (More Robust)
- ◆ Motion Flexibility (special and complex motions) due to conjugate cam geometry
- ◆ 1 to 8 Stop Range

Model Code Designation

Camco Model Code Designation

Number of Stops
663RAD 6 H36-180
 Model

FD162F 8/2 F100-90
 Number of Stops (8/2 = 4 stops)
 Cam Follower diameter in 100ths of an inch (F100 = 1")
 Index Period

For Indexers Only

Approach to Sizing Index Drives

Within each family type (**Roller Gear, Right Angle, Parallel**), IMC offers more than a dozen different sizes of index drives. The first consideration when choosing an **index drive type** is mounting requirements and the geometry of the driven member. The mounting requirements usually determine the type of indexer and then size is selected. Often the geometry (size of dial, for example) helps determine the initial choice. The **index drive size** is verified through data sheet calculations.

All IMC indexers are designed and rated to have a **B₁₀** life of 8,000 hours on the followers and over 100,000 hours on the other major components. The **B₁₀** life is an estimate of time between cam follower replacement. For example, a **B₁₀** life estimate of 15,000 hours means that we can expect 10% of the followers to begin to show wear after 15,000 hours of operation. For this case, IMC would recommend replacing all of the followers after 15,000 hours of continuous operation.

Many helpful software programs have been developed by IMC to assist with the selection process. The following examples will show both a manual method of calculating and a faster method using special software.

All sizing for rotating equipment (motors, gear reducers and indexers) rely on the basic Newtonian Mechanics equation:

$$\text{Torque} = T_i = I \alpha$$

Where **I** is the Rotational Mass Moment of Inertia and **α** is the peak angular acceleration (radians/sec²).

Additional work or friction torque is also added, giving the full equation:

$$T_{\text{Total}} = I \alpha + T_w$$

Where T_w = Work Torque = $\mu \times R \times F$

μ = coefficient of friction, **R** = radius to Work Force and **F** = Force

For smaller diameter dial applications, Work Torque is negligible. For larger diameter dial applications, Work Torque can be significant. The inefficiencies of speed reducers also add to the total Work Torque.

After Torque is calculated we then determine the power requirements through:

$$\text{Power} = T \times \omega = I \times \alpha \times \omega$$

Where ω is the rotational velocity (radians/sec). Note that with an indexing application, α and ω are a function of time or $\alpha = f(t)$ and $\omega = f(t)$.

Since **I** is usually constant, power peaks when the product of α and ω peak. Software automatically chooses this peak product, and the manual data sheet methods rely on **K_i** and **K_f** factors to determine peak power. **K_i** and **K_f** are explained later in this Engineering catalog section.

Input (camshaft) torque requirements are calculated through the conservation of energy equation, Power in = Power out, or:

$$T_{\text{in}} \times \omega_{\text{in}} = T_{\text{out}} \times \omega_{\text{out}}$$

$$\text{Restated, } T_{\text{in}} = T_{\text{camshaft}} = T_c = T_{\text{out}} \times \omega_{\text{out}} / \omega_{\text{in}}$$

Note that:

$K_i \equiv \omega_{\text{out}} / \omega_{\text{in}}$ at peak value of the product of $\alpha_{\text{out}} \times \omega_{\text{out}}$ so we have:

$$T_{c(\text{inertia})} = T_{\text{inertia out}} \times K_i \text{ (for inertia)}$$

Similarly,

$$T_c \text{ (work)} = (T_{\text{work out}} + T_{\text{friction out}}) \times K_f \text{ (for friction and work torque)}$$

Where $K_f \equiv \omega_{\text{out}} / \omega_{\text{in}}$ at ω_{out} (maximum).

Total Camshaft Torque

$$T_c = T_{c(\text{inertia})} + T_{c(\text{work})}$$

Horsepower is calculated based on Camshaft Torque and Speed

$$\text{Power} = \text{HP} = \frac{T_c \times N}{63025 \times E} \text{ (Horsepower)}$$

Where **N** = Camshaft speed in RPM

E = Efficiency of the gear reducer

T_c is in units of in-lbs.

Derivation of Torque Demand Equation for Indexing Dials

Inertia Torque, T_i , is defined by:

$$T_i = I \alpha$$

Where I = Rotational Mass Moment of Inertia (in-lb-sec²)

α = Peak angular acceleration (radians/sec²)

From the "Cam Design" manual by Mr. Clyde H. Moon:

$$\alpha = C_a \frac{\theta_0}{t_2^2}$$

Where C_a = Acceleration Coefficient (5.528 for modified sine motion)

θ_0 = Output Angle or Angle of Index (radians)

t_2 = Index time (seconds)

The Output Angle, θ , is calculated based on the number of stops

$$\theta_0 = \frac{2\pi}{S}$$

Where S = Number of stops

If the modified sine motion has constant velocity the acceleration factor, C_a , must be modified by a ratio of the C_a for the constant velocity relative to the C_a for a modified sine motion without constant velocity.

$$C = \frac{C_{a(cv)}}{C_a}$$

A service factor, SF, of 1.3 is added into the equation

Substituting, acceleration becomes

$$\alpha = \frac{C_a \times C \times SF \times 2\pi}{S \times t_2^2}$$

Type I and Type II Indexers Explained

Some index drives produce two indexes for every one rotation of input shaft. This is due to the geometric constraints of certain motion period and output displacement combinations. If there is a double index, we call this a **Type II indexer** (and $M = 2$). If there is only one index per revolution of input camshaft, we

IMC calculates weight moment of inertia and then converts to mass moment of inertia:

$$I = \frac{Wk^2}{g}$$

Where Wk^2 = Weight Moment of Inertia (lb-in²)

g = Acceleration due to gravity (386.4 in./sec²)

The final torque equation is then

$$T_i = \frac{Wk^2}{g} \frac{C_a \times C \times SF \times 2\pi}{S \times t_2^2}$$

Substituting the constants

$$T_i = \frac{Wk^2 \times 5.528 \times C \times SF \times 2\pi}{386.4 \times S \times t_2^2}$$

$$T_i = \frac{.09 \times SF \times Wk^2 \times C}{S \times t_2^2}$$

With a 1.3 service factor, the Inertia Torque Demand Equation is:

$$T_i = \frac{.117 \times Wk^2 \times C}{S \times t_2^2} \text{ (in.-lbs.)}$$

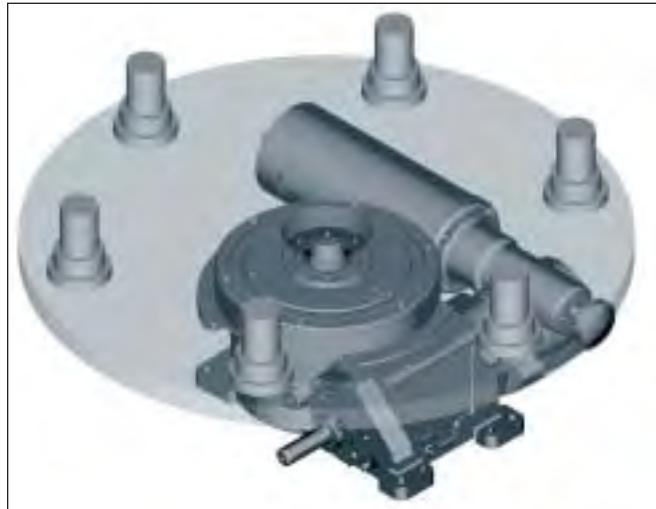

We will use a dial and conveyor application to illustrate.

call this a **Type I indexer** (and $M = 1$). **Type I indexers are more common**. If IMC has a Type II indexer with a "270 degree motion period", the first index is achieved with 135 degrees of real input camshaft rotation ($270 / 2 = 135^\circ$).

Dial Application Example

Number of Stations	(S)	6
Weight of Single Station	(W _s)	5 lbs.
Radius to Station Center	(R _s)	10 in.
Dial Plate Diameter	(D _d)	24 in.
Dial Plate Weight	(W _d)	33.6 lbs.
Dwell Time	(t ₁)	2 sec.
Index Time	(t ₂)	0.5 sec.

Since dwell time is more than 3 times greater than the index time, the application will be cycle-on-demand.

Dial Example

Index Period

$\beta = 270^\circ$ Since this is cycle-on-demand, choose a long, standard motion period.

Index Rate

$$N = \frac{\beta}{6 \times t_2} = \frac{270}{6 \times 0.5} = 90 \text{ index/min.}$$

Inertia Loading

Dial Plate Inertia

$$W_d \times \frac{D_d^2}{8} = 33.6 \times \frac{24^2}{8} = 2419 \text{ lb.-in.}^2$$

Station Inertia

$$W_s \times S \times R_s^2 = 5 \times 6 \times 10^2 = 3000 \text{ lb.-in.}^2$$

Total Wk² External

$$(Wk^2_{(ext.)}) = 2419 + 3000 = 5419 \text{ lb.-in.}^2$$

Preliminary Output Torque

$$T_i = \frac{.09 \times SF \times Wk^2_{(ext.)}}{S \times t_2^2} = \frac{.09 \times 1.3 \times 5304}{6 \times .5^2} = 423 \text{ in.-lbs.}$$

The model 601RDM6H24-270 with a 4.0D overload clutch is the preliminary selection. B₁₀ capacity is 5625 in-lbs. @ 50 index/min. Indexer internal inertia is 110 lbs.-in.² and the overload clutch inertia is 69 lbs.-in.².

Correcting B₁₀ @ 50 to B₁₀ @ 90 to obtain the capacity at the required operating speed of 90 index/minute.

$$\begin{aligned} B_{10} @ 60 &= B_{10} @ 50 \times \left(\frac{50}{90}\right)^{0.3} \\ &= 5625 \times \left(\frac{50}{90}\right)^{0.3} \\ &= 5326 \text{ in.-lbs.} \end{aligned}$$

Inertia Torque Calculation

The following formula includes a safety factor of 1.3.

$$\begin{aligned} T_i &= \frac{.09 \times SF \times (Wk^2_{(ext.)} + Wk^2_{(int.)})}{S \times t_2^2} \\ &= \frac{.117 \times (5419 + 110)}{6 \times .5^2} \\ &= 431 \text{ in.-lbs.} \end{aligned}$$

Camshaft Torque

$$K_f = \frac{C_v \times 360 \times M}{\beta \times S} = \frac{1.7596 \times 360 \times 1}{270 \times 6} = 0.391$$

$$K_i = 0.56 \times K_f = 0.56 \times 0.391 = .219$$

$$T_c = T_i \times K_i = 431 \times .219 = 94 \text{ in.-lb.}$$

Note: C_v ≈ Velocity coefficient for modified sine motion.

Dial Example

(continued)

Camshaft RPM

$$N_c = \frac{\beta}{6 \times t_2 \times M} = \frac{270}{6 \times .5 \times 1} = 90 \text{ RPM}$$

Where M=1 for Type 1 indexers (see p. A-14)

Reducer Selection

Assuming an 1800 RPM motor speed, the model R180 reducer with a 20:1 reduction ratio is selected.

Horsepower

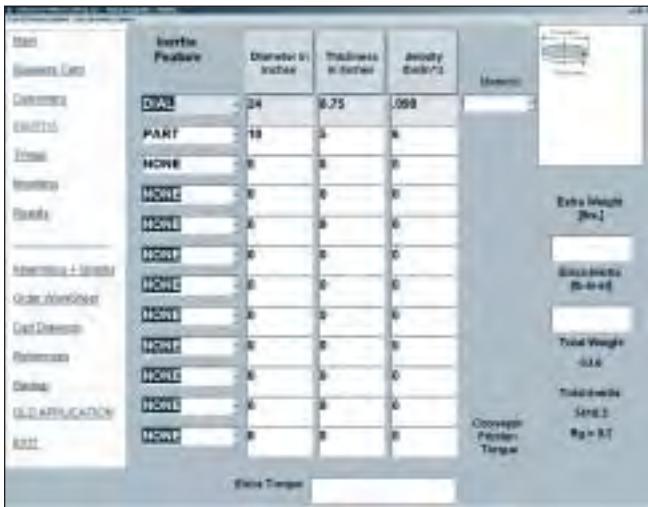

$$Hp = \frac{T_c \times N_c}{63,025 \times E} = \frac{94 \times 90}{63,025 \times .85} = 0.16 \text{ Hp}$$

Due to component compatibility and horsepower requirements, a 1/3 horsepower motor is selected for this application.

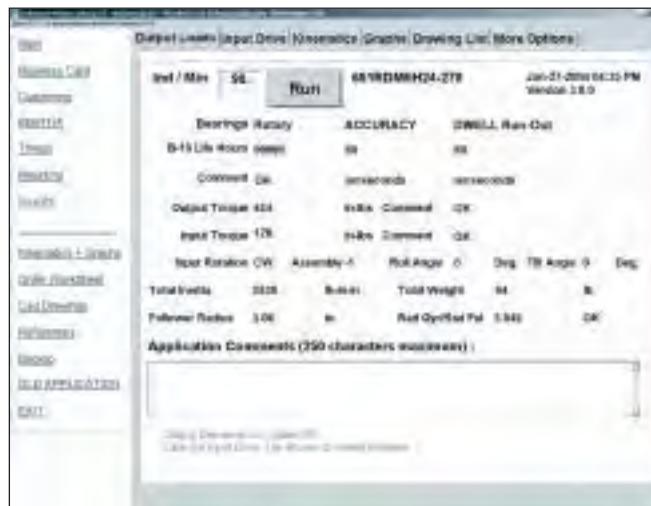

Dial Example Using IMC Software

With the advent of user-friendly, Windows-based software, we can input the data and quickly get the results. The program takes into account additional factors such as internal friction and cam stresses for more precise calculations. Shown below are the input screens and output screens for the same dial application:

Dial Application Input Screen

Dial Application Results Screen

Conveyor Application Example

Over/Under Precision Link Converter

Index Distance	(S _x)	3.00 in.
Index Time	(t ₂)	0.375 sec.
Dwell Time	(t ₁)	3.0 sec.
Sprocket Pitch Dia.	(D _s)	7.8394 in.
Sprocket Weight	(W _{ds})	18.0 lbs.
Number of Teeth on Sprocket	(n)	8
Indexed Parts Weight	(W _p)	64 lbs.
Chain & Fixture Weight	(W _c)	128 lbs.
Coefficient of Friction	(μ)	0.3
Chain Pitch	(p)	3.0 in.

Conveyor Example

Index Period

For this cycle-on-demand application, the index period should be 270°, or larger.

Calculating the number of stops.

$$S = \frac{n \times p}{S_x} = \frac{8 \times 3}{3} = 8$$

For cycle-on-demand applications, the index rate for a continuous run should be used for indexer selection.

$$N = \frac{\beta}{6 \times t_2} = \frac{270}{6 \times .375} = 120 \text{ index/min.}$$

Inertia Calculations

Drive Sprocket

$$W_{ds} \times \frac{D_s^2}{8} = 18 \times \frac{7.8394^2}{8} = 138 \text{ lb.-in.}^2$$

Note: Most IMC Precision Link Conveyors use a chordal compensation cam at the take-up end. No take-up sprocket is necessary.

Chain and Fixtures

$$W_c \times \frac{D_s^2}{4} = 128 \times \frac{7.8394^2}{4} = 1967 \text{ lb.-in.}^2$$

Parts

$$W_p \times \frac{D_s^2}{4} = 64 \times \frac{7.8394^2}{4} = 983 \text{ lb.-in.}^2$$

External Inertia

$$Wk^2_{(ext.)} = 138 + 1967 + 983 = 3088 \text{ lb.-in.}^2$$

Preliminary Inertia Torque

$$T_i = \frac{.09 \times SF \times Wk^2_{(ext.)}}{S \times t_2^2} = \frac{.09 \times 1.3 \times 3088}{8 \times .375^2} = 321 \text{ in.-lbs.}$$

The equation used to calculate T_i includes a service factor of 1.3

Friction Torque

$$T_f = (W_c + W_p) \times \frac{D_s}{2} \times \mu = (128 + 64) \times \frac{7.8394}{2} \times 0.3 = 226 \text{ in.-lbs.}$$

Work Torque

The parts are being translated horizontally, therefore there is no work torque.

Preliminary Output Torque

$$T_o = T_i + T_f + T_w = 321 + 226 + 0 = 547 \text{ in.-lbs.}$$

Using the appropriate catalog section, select an index drive corresponding to the preliminary torque requirements.

$$B_{10} = \frac{T_o}{\left(\frac{50}{N}\right)^{0.3}} = \frac{547}{\left(\frac{50}{120}\right)^{0.3}} = 711 \text{ in.-lbs.}$$

Select 401RA8H24-270, modified sine motion (ms), Wk²_(int.) = 15 lbs.-in.², B₁₀ capacity = 1463 in.-lbs.

Conveyor Example

(continued)

Overload Protection

Output overload protection should be used with this application. A large instantaneous gear ratio at the start of index makes output overload protection the preferred method for protecting the index drive. With an output overload clutch, jams or overloads at the start of index can easily be detected prior to damaging the indexer.

From your IMC indexer catalog, select the appropriate clutch model for the index drive being used.
 Clutch model 2.3FC-SD with $Wk^2_{(cl.)} = 31$ lbs.-in.² is chosen.

Inertia Torque

The actual inertia torque including indexer internal inertia and clutch inertia can now be calculated.

$$\begin{aligned} T_i &= \frac{.09 \times SF \times (Wk^2_{(ext.)} + Wk^2_{(int.)} + Wk^2_{(cl.)}) \times C}{S \times t_2^2} \\ &= \frac{.09 \times 1.3 \times (3088 + 15 + 31) \times 1}{8 \times .375^2} \\ &= 326 \text{ in.-lbs.} \end{aligned}$$

Output Torque

$$T_o = T_i + T_f + T_w = 326 + 226 + 0 = 552 \text{ in.-lbs.}$$

C , K_i and K_f

Values for C , K_i and K_f can be calculated or found in the table on page A-19.

$$C = 1.0, K_i = 0.16, K_f = 0.29$$

Camshaft Torque

$$\begin{aligned} T_c &= (T_i \times K_i) + (T_f \times K_f) + (T_w \times K_f) \\ &= (326 \times 0.16) + (226 \times 0.29) + 0 \\ &= 118 \text{ in.-lbs.} \end{aligned}$$

Camshaft RPM

$$N_c = \frac{\beta}{6 \times t_2 \times M} = \frac{270}{6 \times .375 \times 1} = 120 \text{ RPM}$$

This is a type 1 unit, therefore $M = 1$.

For type 2 or 3, $M = 2$, $M = 3$.

From the Right Angle Series indexer catalog section, an R225 reducer with a 15:1 reduction ratio is chosen.

Horsepower

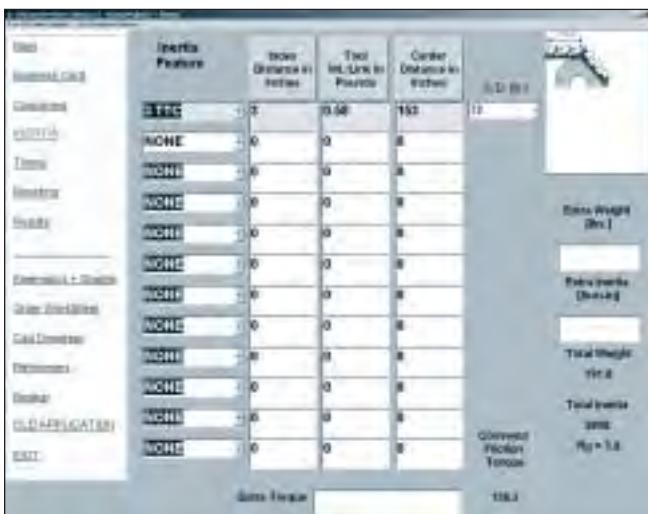

$$Hp = \frac{T_c \times N_c}{63,025 \times E} = \frac{118 \times 120}{63,025 \times .75} = 0.30 \text{ Hp}$$

Due to component compatibility and horsepower requirements, a one horsepower motor is chosen for this application.

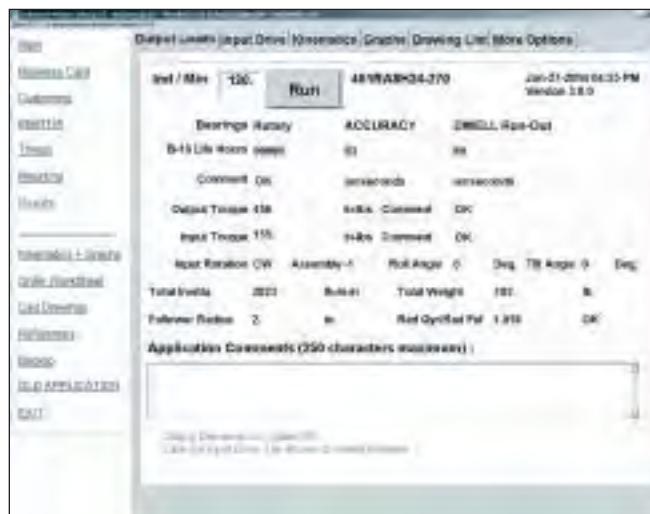

Conveyor Example Using IMC Software

As demonstrated for the dial application, we can input the conveyor data into the software program and quickly get results. Shown below are the input screens and output screens for the conveyor application:

Conveyor Example Input Screen

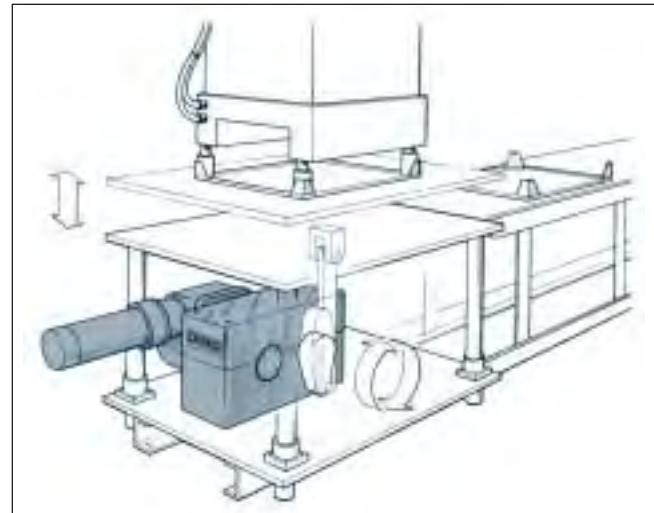

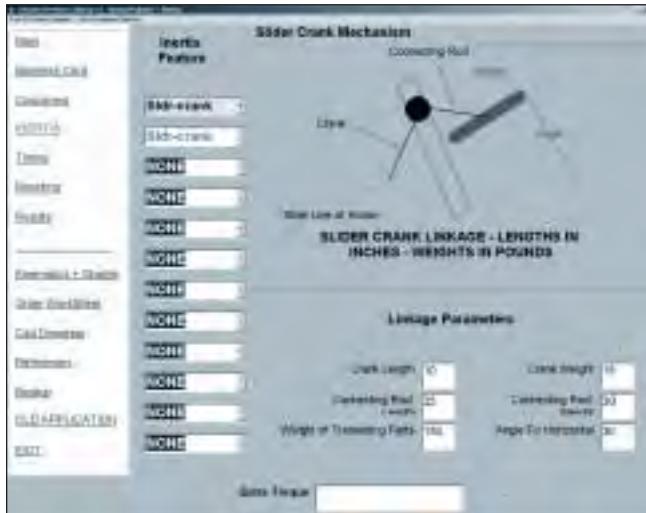

Conveyor Example Results Screen

Brief Oscillator Example

IMC software can handle a variety of slider-crank, scotch yoke and 4-bar mechanisms.

Slider Crank Linkage Example

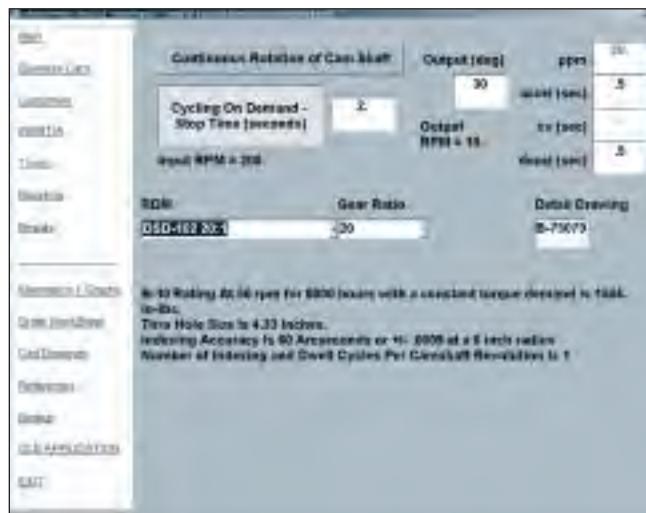

Servo-Mechanical Example

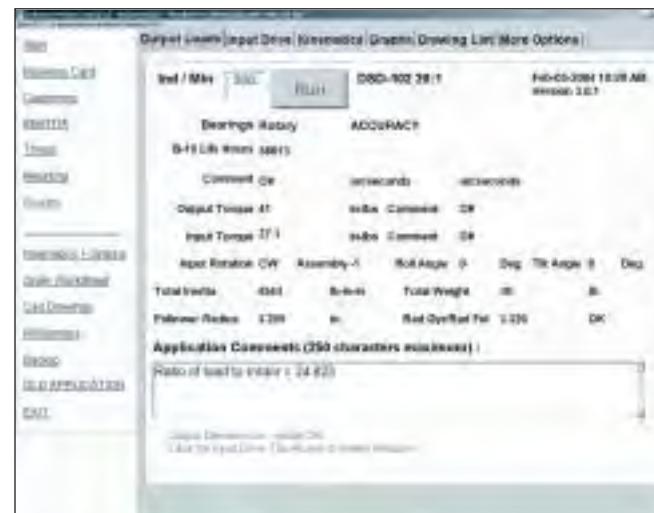

Camco-Ferguson software can also be used to size servo-driven indexers such as the Flex-i-Dex and Indexers with constant-lead cams. The following illustrations show input and output data for a typical servo-driven application.

Flex-i-Dex Constant Lead Indexer

Servo Application Output Screen

Cycle-On-Demand vs. Continuous Running Applications

If the input shaft (camshaft) of an index drive runs continuously, the ratio of the index time and stop (dwell) time are fixed and a function of the number of degrees on the cam that impart motion to the output shaft (motion period).

If t_1 is the dwell time and t_2 is the index time, total time $t_t = t_1 + t_2$

Typically, the motion period of the cam is rarely less than 90 degrees, due to the geometry constraints of cam design. To illustrate, let's choose a 90 degree index period (β_2), leaving 270 degrees (β_1) for dwell time ($90^\circ + 270^\circ = 360^\circ$ total).

Assume 60 RPM camshaft or $N = 60$.

Then

$$\beta_{\text{total}} = 360^\circ = 6 \times N \times t_{\text{total}} \text{ or}$$

$$t_{\text{total}} = \frac{360}{6N} = \frac{360}{6 \times 60} = 1 \text{ sec.}$$

The index time

$$t_2 = \frac{\beta_2}{6N} = \frac{90}{6 \times 60} = 0.25 \text{ sec.}$$

And dwell time

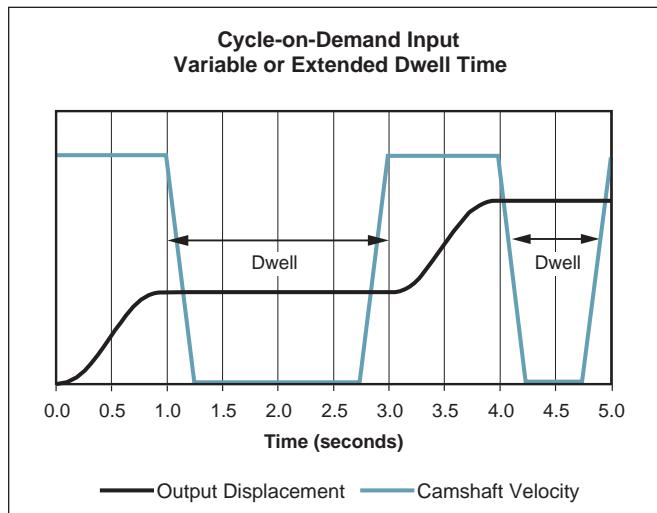

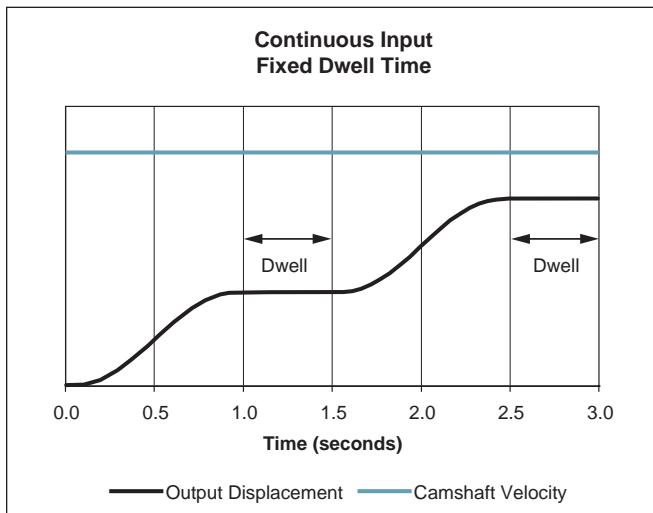

$$t_1 = \frac{\beta_1}{6N} = \frac{270}{6 \times 60} = 0.75 \text{ sec.}$$

Note $t_t = t_1 + t_2 = .75 + .25 = 1.0 \text{ sec.}$

In this example the ratio of dwell time to index time is .75 sec / .25 sec or 3:1.

Suppose you need more time for dwell, due to the manufacturing process required of the machine. You can then stop the camshaft in dwell for a specified amount of time, and then re-start the camshaft. This is known as cycle-on-demand.

Example: You want to index in 0.25 seconds, but stay in the dwell position for 10 seconds. By using a brake motor (or motor with clutch-brake module), you stop the camshaft and then restart after the required 10 seconds. By rotating the camshaft at 60 RPM when the motor is engaged, you achieve the desired 0.25 index time. These two charts illustrate and summarize the two concepts:

Important Formulas

Refer to page A-16 for Nomenclature

Torque Due to Inertia

$$T_i = \frac{.09 \times SF \times (Wk^2_{(ext.)} + Wk^2_{(int.)} + Wk^2_{(cl.)}) \times C}{S \times t_2^2}$$

Torque Due to Friction (dial application)

$$T_f = (1/2W_d + W_s) \times R_\mu \times \mu$$

Where W_d = Dial Weight

W_s = Total weight of the stations

R_μ = the radius where rollers or support bearing contact the dial plate

μ = coefficient of friction

Torque Due to Work

$$T_w = W_w \times R_w$$

Where W_w = work force or work load

R_w = radius at which the force is acting, perpendicular to the axis of rotation

Total Output Torque

$$T_t = T_i + T_f + T_w$$

Camshaft Torque

$$T_c = T_i \times K_i + (T_f + T_w) \times K_f$$

Relationship between cam angle, time and RPM:

$$\beta = 6 \times N \times t \times M$$

where β (degrees), N (RPM), t (sec.), M (unitless)

$$\text{or } N = \beta / (6 \times M \times t)$$

Factor for calculating camshaft torque due to inertia at indexer output, for modified sine motions:

$$K_i = 0.56 K_f$$

Factor for calculating camshaft torque due to friction and work load at indexer output:

$$K_f = \frac{C_v \times 360 \times M}{\beta \times S}$$

A chart of K_i and K_f factors are listed on page A-19.

Motion Velocity Factor for Modified Sine Motion (Moon Velocity Factor)

$$C_v = \frac{1.7596}{1 + (F \times 0.7596)} \text{ if } F = 0, C_v = 1.7596$$

Where F = % of constant velocity, e.g. $F = 0.25$ for 25% constant velocity, $F = 0$ for pure Modified Sine Motion (no constant velocity).

Motion Acceleration Factor (Moon Acceleration Factor)

$$C_a = \frac{C_v \times \pi}{1 - F} \text{ if } F = 0, C_a = 5.5280$$

Constant Velocity Load Adjustment Factor

$$C = \frac{C_a}{5.5280} \text{ or } C = \frac{1}{1 - 0.24F - 0.76F^2}$$

Input Gear Ratio

$$G_i \equiv N_{motor} / N_{camshaft} = N_m / N_c$$

Output Gear Ratio

$$G_o \equiv D_{driver} / D_{driven} = D_r / D_n$$

Effective Radius of Gyration

$$k = \sqrt{\frac{\sum Wk^2}{\sum W}}$$

k is the theoretical radius at which all of the weight would be concentrated to produce an equivalent weight moment of inertia

Speed Correction Factor

$$F_s = \left(\frac{50}{N}\right)^{0.3}$$

Horsepower

$$HP = \frac{T_c \times N_c}{63025 \times E}$$

Nomenclature

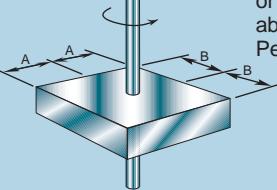

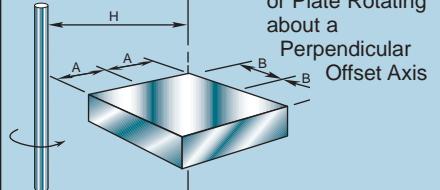

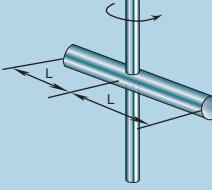

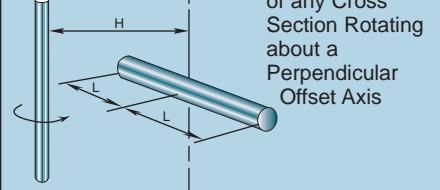

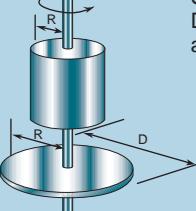

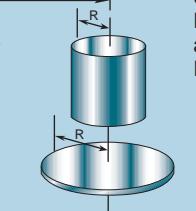

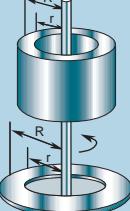

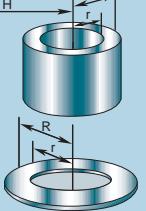

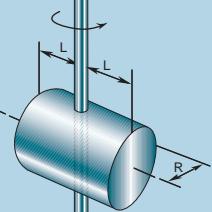

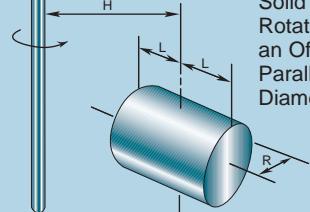

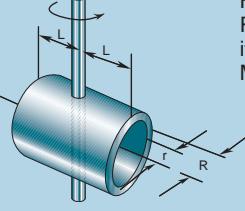

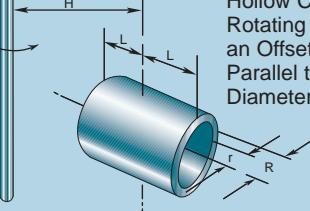

Terms used for Engineering Calculations

Symbol	Units	Description	Symbol	Units	Description
β	deg.	Index Period	R_f	in.	Friction Force Radius
μ	—	Coefficient of Friction	R_s	in.	Radius to Station Center
B_{10}	in.-lbs.	Basic Dynamic Capacity of the Indexer at a Defined Index Rate	R_w	in.	Radius to Point of Work Load Application
C	—	Constant Velocity Load Adjustment Factor	S	—	Number of Stops or Stations Per One Revolution of the Output
C_a	—	Motion Acceleration Factor	SF	—	Service Factor 1.3
C_d	—	Factor for Calculating Output Torque	S_x	in.	Linear Index Distance
C_v	—	Motion Velocity Factor	T_c	in.-lbs.	Camshaft Torque
D_d	in.	Dial Plate Diameter	T_f	in.-lbs.	Friction Torque at the Output
D_n	in.	Diameter of Driven Pulley or Gear	T_i	in.-lbs.	Inertia Torque at the Output
D_r	in.	Diameter of Drive Pulley or Gear	T_o	in.-lbs.	Total Output Torque
D_s	in.	Pitch Diameter of Drive Sprocket(s)	T_s	in.-lbs.	Static Torque
D_t	in.	Pitch Diameter of Take-up Sprocket(s)	T_w	in.-lbs.	Work Torque at the Output
E	—	Reducer Efficiency	t	sec.	Total Cycle Time ($t_1 + t_2$)
F	—	Percent of Constant Velocity	t_1	sec.	Dwell Time
F_s	—	Index Rate Factor	t_2	sec.	Index Time
G_i	—	Input Gear Ratio	W_c	lbs.	Weight of Chain and Fixtures
G_o	—	Output Gear Ratio	W_d	lbs.	Weight of Dial Plate
k	in.	Radius of Gyration	W_{ds}	lbs.	Weight of Drive Sprocket(s)
K_f	—	Factor for Calculating Cam Shaft Torque Due to Friction and Work Load on Output	$Wk^2_{(ext.)}$	lbs.-in. ²	External Weight Moment of Inertia at Output
K_i	—	Factor for Calculating Cam Shaft Torque due to Inertia at Output	$Wk^2_{(int.)}$	lbs.-in. ²	Internal Weight Moment of Inertia at Output
M	—	Type of Cam (Symbol) Integer Number 1, 2 or 3	$Wk^2_{(cl.)}$	lbs.-in. ²	Clutch Weight Moment of Inertia
N	ind./min.	Index Rate	W_n	lbs.	Weight of Driven Pulley or Gear
n	—	Number of Teeth in Conveyor Drive Sprocket	W_p	lbs.	Weight of Total Parts to be Indexed
N_c	RPM	Camshaft Rotation per Minute	W_r	lbs.	Weight of Drive Pulley or Gear
N_m	RPM	Power Source Rotation per Minute (Motors, Line Shaft, etc.)	W_s	lbs.	Weight of Each Station (Fixture & Part)
p	in.	Chain Pitch of Conveyor Sprocket	W_t	lbs.	Weight of Take-up Sprocket(s)
			W_w	lbs.	Work Load
			Y	in.	Dial Plate Thickness

Inertia Tables

Multiply radius of gyration squared (k^2) by weight to get weight moment of inertia for torque demand calculation.

Radius of Gyration

Body With Central Axis of Rotation	k^2	Body with Offset Axis of Rotation	k^2
Rectangular Prism or Plate Rotating about its Central Perpendicular Axis 	$\frac{A^2 + B^2}{3}$	Rectangular Prism or Plate Rotating about a Perpendicular Offset Axis 	$\frac{A^2 + B^2}{3} + H^2$
Long Thin Rod of any Cross Section Rotating about its Central Perpendicular Axis 	$\frac{L^2}{3}$	Long Thin Rod of any Cross Section Rotating about a Perpendicular Offset Axis 	$\frac{L^2}{3} + H^2$
Solid Cylinder or Disc Rotating about its Own Axis 	or $\frac{R^2}{2}$ $\frac{D^2}{8}$	Solid Cylinder or Disc Rotating about an Offset Parallel Axis 	$\frac{R^2}{2} + H^2$
Hollow Cylinder or Flat Ring Rotating about its Own Axis 	$\frac{R^2 + r^2}{2}$	Hollow Cylinder or Flat Ring Rotating about an Offset Parallel Axis 	$\frac{R^2 + r^2}{2} + H^2$
Solid Cylinder Rotating about its Diameter at Mid-Length 	$\frac{L^2}{3} + \frac{R^2}{4}$	Solid Cylinder Rotating about an Offset Axis Parallel to its Diameter 	$\frac{L^2}{3} + \frac{R^2}{4} + H^2$
Hollow Cylinder Rotating about its Diameter at Mid-Length 	$\frac{L^2}{3} + \frac{R^2 + r^2}{4}$	Hollow Cylinder Rotating about an Offset Axis Parallel to its Diameter 	$\frac{L^2}{3} + \frac{R^2 + r^2}{4} + H^2$

Kinematic Calculations

In the "Cam Design Manual for Engineers, Designers, and Draftsmen," Clyde H. Moon developed factors for quickly calculating maximum velocity and maximum acceleration for an application. These are known as "Moon factors." For a Modified Sine Motion, the Moon factors are $C_v = 1.7596$ and $C_a = 5.5280$. These factors are unitless and a chart of various Moon factors are listed on page A-19.

If we move an object 12 inches in 0.3 seconds using a Modified Sine Motion, the maximum velocity (at mid-point of index) is:

$$\begin{aligned} V_{\max} &= \frac{C_v \times \text{Displacement}}{t_2^2} \\ &= \frac{1.7596 \times 12}{0.3} = 70.4 \text{ inches/second} \end{aligned}$$

The maximum acceleration is:

$$\begin{aligned} A_{\max} &= \frac{C_a \times \text{Displacement}}{t_2^2} \\ &= \frac{5.528 \times 12}{0.3^2} = 737 \text{ inches/sec}^2 \\ &= 1.9 \text{ g's} \end{aligned}$$

It can also be used for calculating rotational g force (also known as centrifugal force):

Index a 15-lb. object at a 40 inch radius 90 degrees in 0.5 seconds:

$$\begin{aligned} \text{Force}_{\text{centrifugal}} &= \text{Mass} \times a_{\text{radialmax}} \\ &= \text{Mass} \times \omega_{\max}^2 \times R \\ &= \frac{15}{386.4} \times \left(\frac{1.7596 \times 90^\circ \times \pi}{180^\circ \times 0.5} \right)^2 \times 40 \\ &= 47.4 \text{ lbs.} = \frac{47.4}{15} \text{ g's} = 3.2 \text{ g's} \end{aligned}$$

The tangential force component is:

$$\begin{aligned} \text{Force}_{\text{Tangential}} &= \text{Mass} \times a_{t\max} \\ &= \frac{15}{386.4} \times \frac{5.528 \times 40 \times 90^\circ \times \pi}{180^\circ \times 0.5^2} \\ &= 53.9 \text{ lbs.} = \frac{53.9}{15} \text{ g's} = 3.6 \text{ g's} \end{aligned}$$

K_i *K_f* Tables & Moon Factor Tables (*C_v* and *C_a*)

Values listed are for type 1 units, multiply values by 2 for type 2 units. For motions with constant velocity, multiply K factor by the adjustment factor listed below.

Number of Stops	Index Period (Modified-Sine Motion)													
	90°		120°		150°		180°		210°		270°		330°

Accuracy

IMC intentionally chooses to state the Maximum Error as the indexer's worst possible accuracy. While some index drive manufacturers use the average as their stated accuracy and decline to state the repeatability, IMC takes a more conservative approach.

Measurement Method

The output angular error of an index drive is measured using a laser collimator mounted to a precision rotary table. The laser collimator is accurate to 2 arc seconds

and repeatable to 1 arc second. The indexer will make 3 to 6 complete turns of its output and accuracy measurements are recorded. The accuracy is the mean between the maximum and minimum error. The repeatability is one-half the difference between the maximum and minimum error.

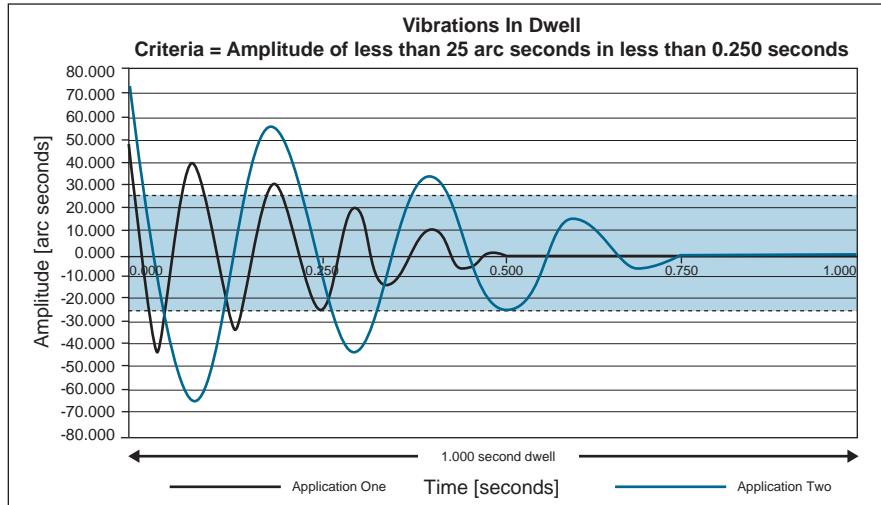

Upon request, IMC can provide special accuracy reports for a particular indexer.

Vibration

Cam-actuated index drives are frequently chosen because of their stability in dwell, especially when operating at high speeds. It is important to ascertain that the entire system is well designed to prevent any unwanted vibrations. Vibration is a function of the index time, index rate, friction (dampens the system), input and output connections, torsional spring rate and the natural frequency of the indexer and driven members.

One simple method to avoid problems is to calculate the ratio of the effective radius of gyration (k) to the cam follower pitch radius. This method does not always produce consistent results. For example, a system with a large effective radius of gyration can be run at slow speed and there are no observable vibrations in dwell. Friction also helps prevent vibration, as in the case of precision link conveyor systems.

(continued)

Vibration

(continued)

IMC has developed stability criteria that effectively predict vibration effects. The criteria require that the amplitude of the vibration must be less than 25 arc seconds in 25% of the dwell time. IMC's loading programs automatically check for this prerequisite.

Vibration can be avoided by following the recommended input and output connection methods and confirming the vibration effect of the specific application using IMC's loading software program.

Emergency Stop

Emergency stops can occur during any part of the index motion. OSHA and other regulatory agencies would like this stop to occur instantaneously. The laws of physics require that the stop occurs within a finite time – and this time cannot be too extended (for it would defeat the purpose of an emergency stop).

Intuition suggests that the worst possible time for an emergency stop is at mid-motion of the index, at peak output velocity. At that moment we have the greatest amount of kinetic energy. The mathematics of motion curves prove otherwise. For a particular type of motion, computer software analysis is the best method for determining the worst case scenario. Upon request, IMC engineering staff can evaluate and calculate the maximum expected stop times for specific applications and also evaluate the resulting stresses on the cam, cam followers, follower wheel and input components (reducer, motor, clutch and brake). Normal forces on the cam follower must not exceed the vendor's recommended maximum and the cam and camshaft stress must not exceed the

ultimate yield stress of the material (the cam and camshaft are normally designed for fatigue and not strength).

For an application with an Emergency stop requirement, IMC recommends that the drive package for an indexer should be a low ratio worm gear drive (10:1 or 15:1) along with a helical primary (5:1 or 5:1). This should be coupled to an air or hydraulic clutch-brake. Wet type or Hydro-viscous type clutch-brakes are recommended due to their low inertia of the cyclic parts and high heat dissipation capability. In contrast, dry type clutch-brakes wear quickly. In an Emergency stop mode, the clutch-brake disengages the motor since the low-ratio gear combination (low ratio worm and helical primary combination) will be intentionally back driven. The brake then dissipates the kinetic energy of the Emergency stop. For further details, please contact your IMC sales representative or IMC application engineer.

Overload Protection

IMC offers a wide variety of output overload clutches and input overload clutches designed to protect the indexer drive. Overload clutches are recommended due to the nature of indexing. At the very beginning of an index, the input displacement is large while the output displacement is minuscule. At that precise moment, the instantaneous gear ratio of the drive is extremely high – almost infinite. Small amounts of input torque produce tremendous output torque. If there are any machine components or product parts jamming the mechanism (dial, conveyor belt or other linkage), the tooling or the index drive itself could be damaged. IMC clutches are offered in a wide assortment of geometries to accommodate shaft-to-shaft, flange-to-shaft and dial applications. IMC also offers internal overload clutches on certain models to protect the clutch from foreign contamination. IMC overload clutches for indexing applications have a single position reset point to ensure accuracy and repeatability.

Typically, proximity switches are mounted adjacent to the clutch to sense an overload condition (sense the detector plate movement) and shut down the machinery.

Lubrication

Indexers

IMC Index drives are normally shipped without oil to avoid possible leakage during transit. Each particular index drive mounting position requires a different oil level. A "bulls eye" type oil level sight gauge is supplied with each index drive. The unit should be filled with oil until the level reaches the middle of this sight gauge.

Lubricating oils for use in an index drive should be high quality, well-refined petroleum oils or synthetic lubricants with extreme pressure additives. They may be subject to high operating temperatures, so they must have good resistance to oxidation. The lubricant must meet these specifications: MIL-PRE-2105E or SAE 80W-140, ISO 220 or AGMA 5 with EP (extreme pressure) additives.

Some units use grease rather than oil. In this case, the unit will be shipped with the grease. Generally, IMC uses a lithium grease such as Mobilith AW-2.

Gear Reducers

Lubricating oils for gear reducers should also be of high quality, well-refined petroleum oils. These oils should meet AGMA 8 or 8A specifications or ISO 680 or 1000 specifications. Oils with EP additives should not be used if the reducer contains bronze parts.

If you have any questions regarding lubricants, please contact IMC's engineering department.

Axial, Radial & Moment Capacity

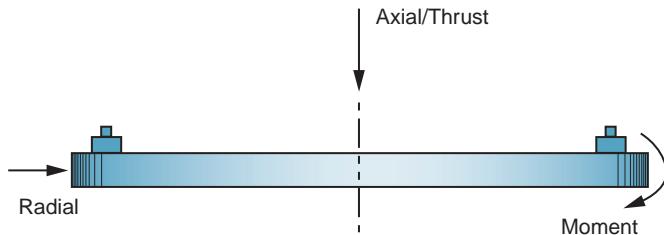

In addition to the B_{10} capacity, which is based on the cam follower capacity, an index drive also has a load capacity based on the bearings supporting the output. Several load conditions can be present in an application:

- ◆ **Axial or Thrust Capacity** is the maximum balanced load the indexer's output bearing can support. Due to the use of large bearings, this load capacity generally does not need to be addressed in normal applications.
- ◆ **Radial Capacity** is the maximum side load of the output bearing, applied through and perpendicular to the axis of rotation.

- ◆ **Moment Capacity** is the maximum overturning or unbalanced load capacity of the output bearing.

The Axial, Radial and Moment capacities for most indexers are listed in the appropriate product section.

Exceeding the capacity of the output bearing with any of these types of forces can cause permanent deformation of the cam, fractured cam followers, or output bearing failure. Contact IMC engineering for analysis of application with special requirements regarding any of these conditions.

Input Considerations

All load calculations are based on a constant velocity input (camshaft speed) during the index. If there are any speed variations on the input shaft, these variations are amplified on the output shaft (velocities are accelerated and accelerations become jerk). It is very important to have a controlled motor speed and a reducer ratio sufficient to dampen any input speed variations. If input belts are used, they must be tightened to prevent any slip or belt jumping when positive

torque changes to negative torque (input shafts typically see both positive and negative torque in an indexing application). Pulleys should be maximized to the largest diameter that can fit on the camshaft. Adjustable tensioning idler pulleys are highly recommended. If you have any questions regarding input speed control, please contact your local IMC sales representative or IMC application engineer.

Output Considerations

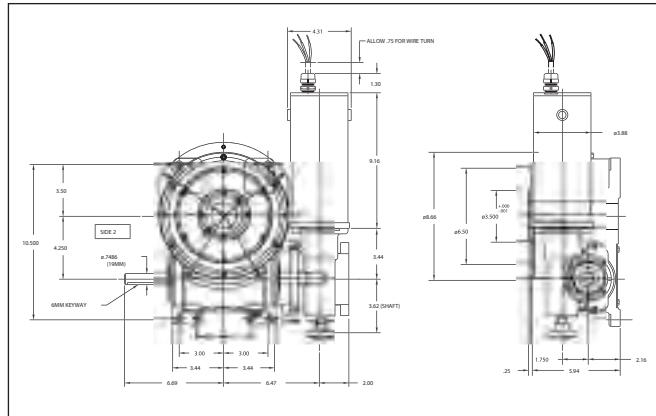

Indexing always imparts positive and negative torques on the driven members. All connections should be tight and doweled whenever possible. Shaft coupling connections should have an interference fit and not

depend on the keyway for tightness, as any clearance in the key stock or keyways will eventually cause the connection to loosen.

IMC Online

The IMC website, www.camcoindex.com, features useful tools for those responsible for specifying, applying and servicing Camco and Ferguson products. These include:

- ◆ 2-D and 3-D CAD drawings in a variety of formats
- ◆ General and Product-specific Service Manuals
- ◆ Product Catalogs
- ◆ Contact information for local sales representatives

RDM Index Drives

Features

The RDM Series Index Drive is ideal for rotary dial applications with features including:

- ◆ Large Output Mounting Surface supported by 4-point contact bearing offering superior thrust and moment capacity
- ◆ Large Center Thru Hole
- ◆ Low Profile
- ◆ Complete, Motorized Drive Packages
- ◆ Optional Output Overload Clutch

Technical Specifications**Output Load Capacity – loads carried during index**

Radial 730 lbs

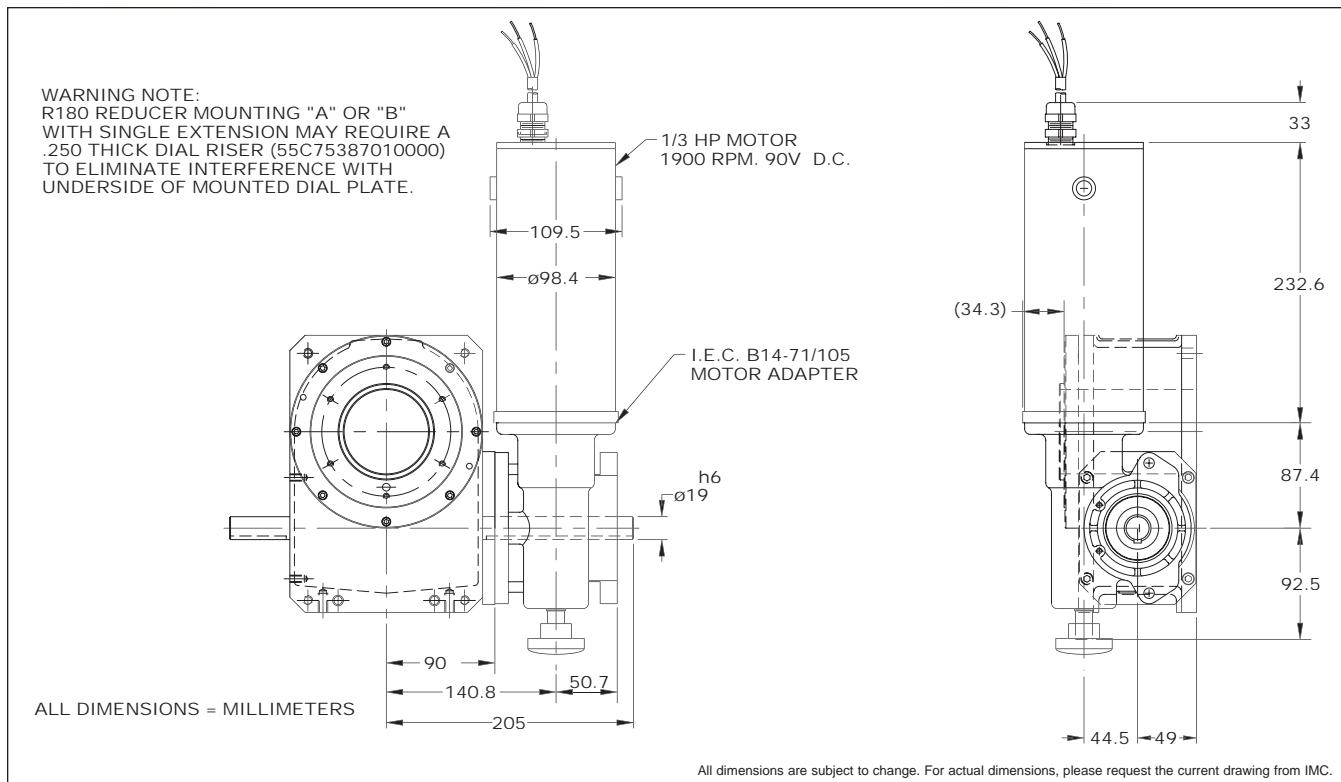

Thrust/Axial 1,810 lbs

Moment 1,810 in.-lbs

Typical Application Dial Diameter: 8 in. to 28 in.

Accuracy ±44 arcsec / ±.003" at 14" Radius

Repeatability ±22 arcsec / ±.0014" at 14" Radius

Standard Package

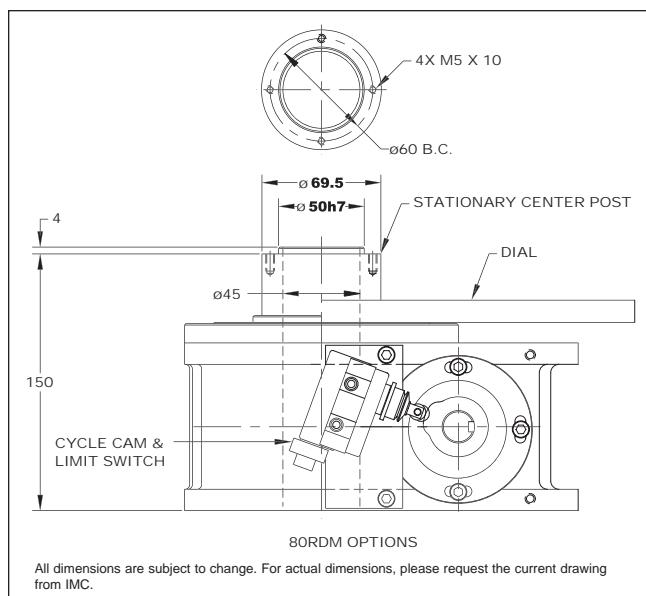

80RDM Indexer with

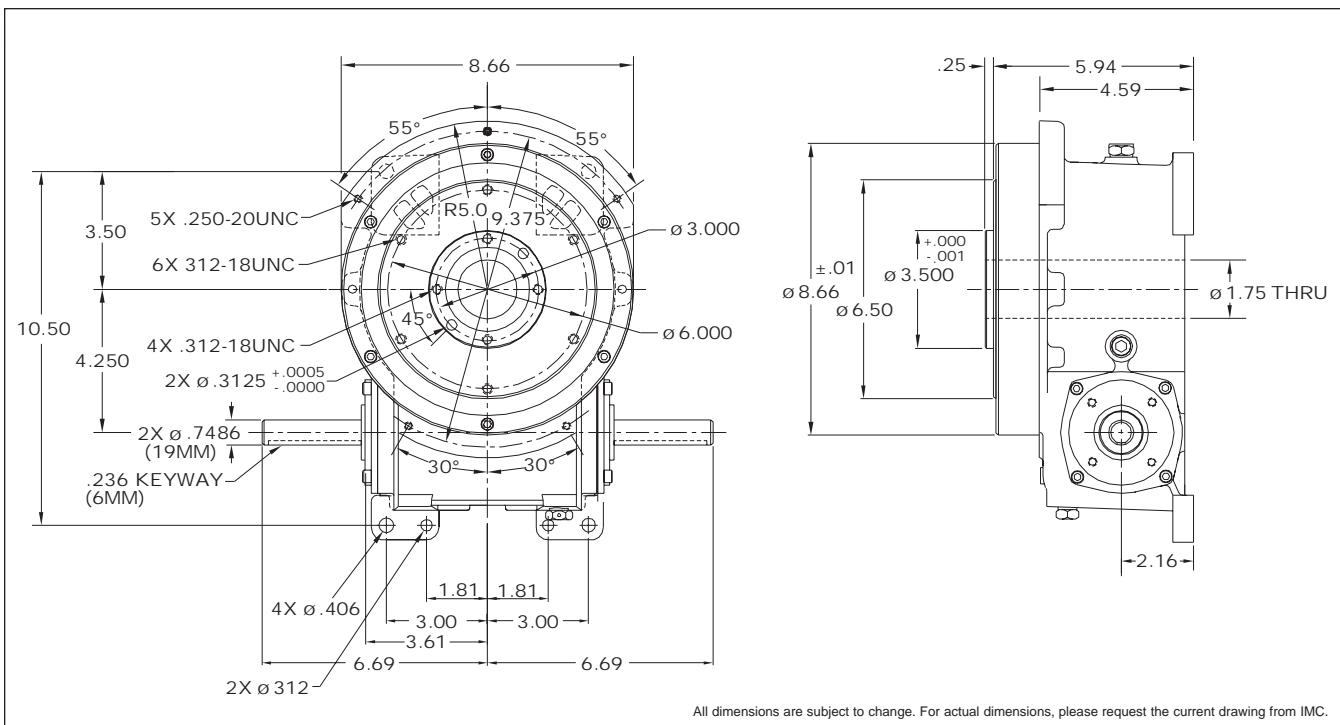

- ◆ R180 Reducer (Ratios from 5:1 to 60:1)
 - Double Extended Worm Shaft (Input)
 - Worm Shaft Handwheel
- ◆ Double Extended Camshaft (Input Shaft)
- ◆ Center Thru Hole (70 mm / 2.76 in. Diameter)
- ◆ 1/3 hp DC Motor

- ◆ Varipak DC Motor Control (up to 30 cpm)
- ◆ Cycle Cam and Limit Switch Mounted to Camshaft
- ◆ Right Hand Cam
- ◆ Universal Mounting Capability

Optional Accessories

- ◆ 1/3 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ SW-030 or SW-040 reducer with Option Internal OLC
- ◆ Stationary Center Post
- ◆ Dual Cam and Limit Switch
- ◆ Base Riser Blocks
- ◆ Electric Clutch-Brake
- ◆ Air Motor Drive Package
- ◆ 180IOC Input Overload Clutch
- ◆ Left Hand Cam
- ◆ Relief in Dwell for shot-pin applications
- ◆ Custom Dial Plate

Moment 61,200 in.-lbs

Typical Application Dial Diameter: 26 in. to 96 in.

Accuracy ±27 arcsec / ±.006" at 48" Radius

Repeatability ±7 arcsec / ±.0016" at 48" Radius

Standard Package

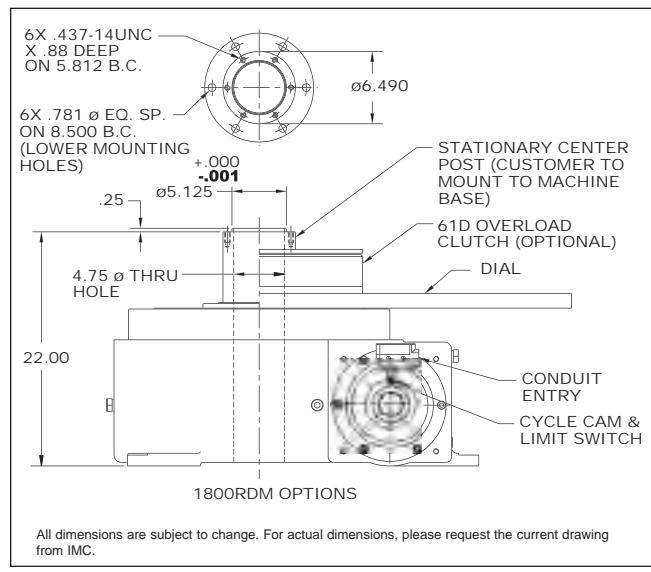

1800RDM Indexer with

- ◆ 7400C Reducer (Ratios from 5:1 to 60:1)
- ◆ Double Extended Camshaft (Input Shaft)
- ◆ Center Thru Hole (6.50 in. Diameter)

- ◆ 3 hp DC Motor
- ◆ Cycle Cam and Limit Switch Mounted to Camshaft
- ◆ Right Hand Cam

Optional Accessories

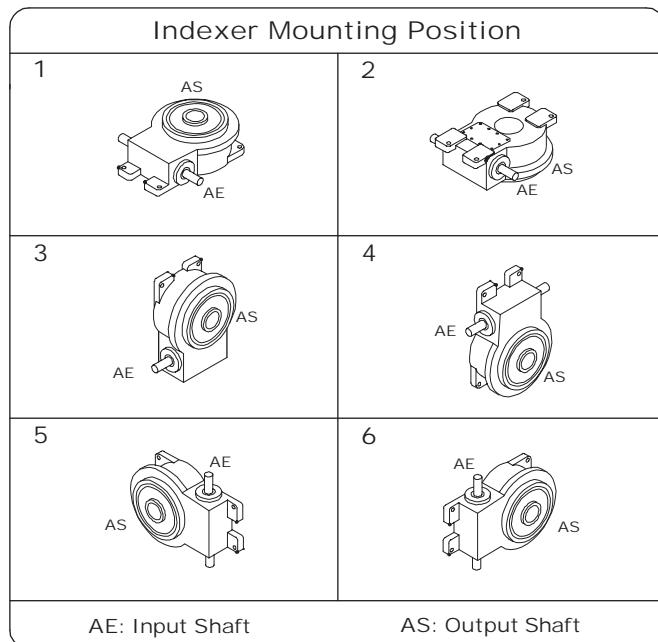

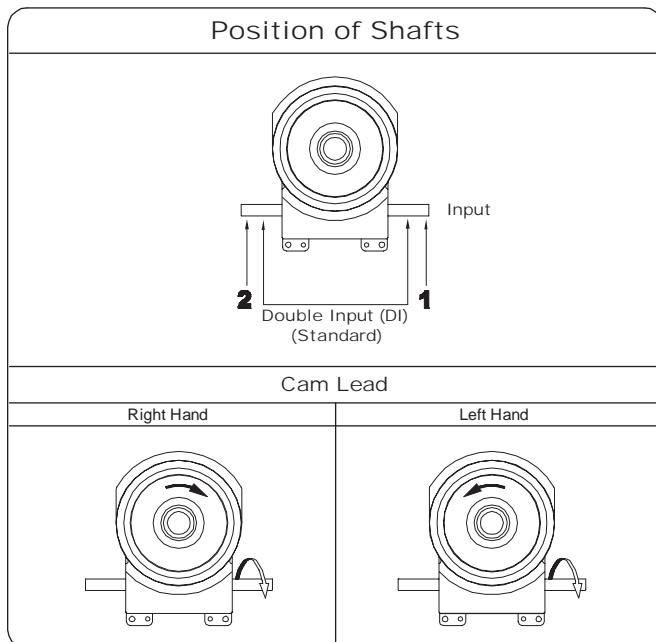

- ◆ 2 or 3 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ 2 hp DC Motor with Varipak DC Motor Control (up to 30 cpm)
- ◆ 7500C Heavy Duty Reducer (Ratios from 5:1 to 60:1)
- ◆ Output Overload Clutch model 61D
 - Available Settings (in-lbs): 23000, 36000, 44000, 50000, 60000
- ◆ Stationary Center Post
- ◆ Dual Cam and Limit Switch
- ◆ Base Riser Blocks
- ◆ Electric Clutch-Brake
- ◆ Air Clutch-Brake
- ◆ 400IOC or 500IOC Input OLC
- ◆ Left Hand Cam
- ◆ Relief in Dwell for shot-pin applications
- ◆ Custom Dial Plate

Indexer Ordering Procedure

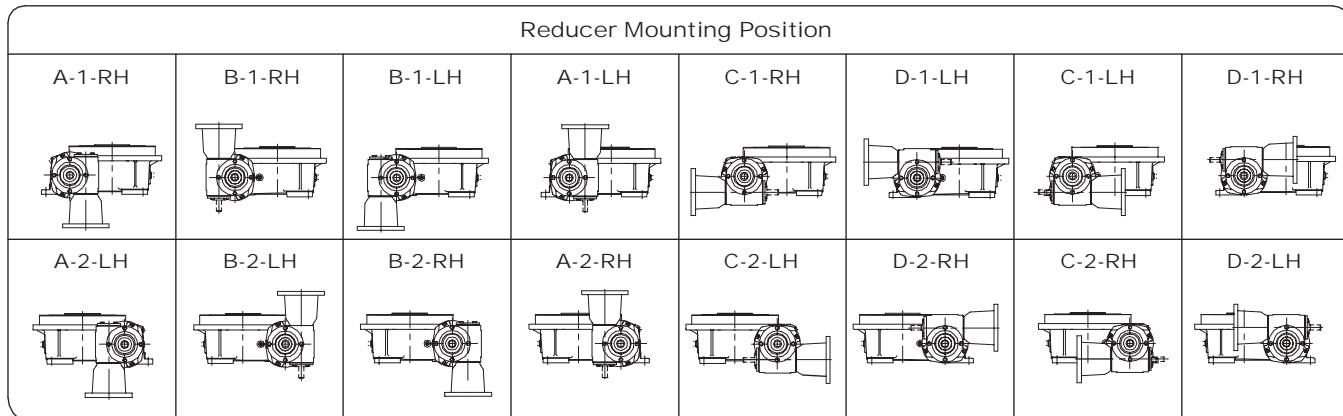

1. Model
2. Input Shaft Configuration
 - ◆ Side 1
 - ◆ Side 2
 - ◆ Double Input – DI (Standard)
3. Cam Lead (Helix)
 - ◆ Right Hand (Standard)
 - ◆ Left Hand

NOTE: Input may rotate in either direction to achieve desired direction of output rotation.
4. Indexer Mounting Position: 1-6

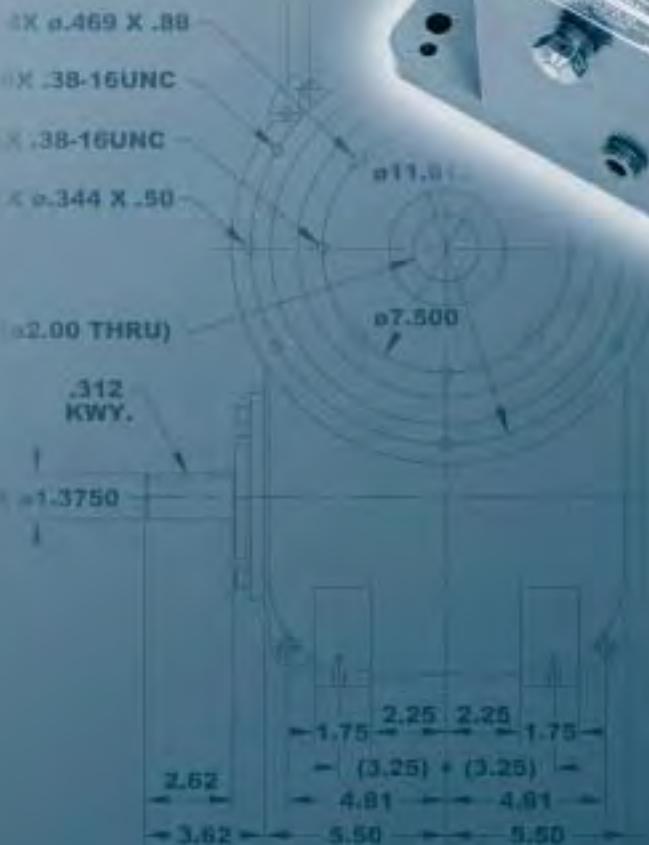

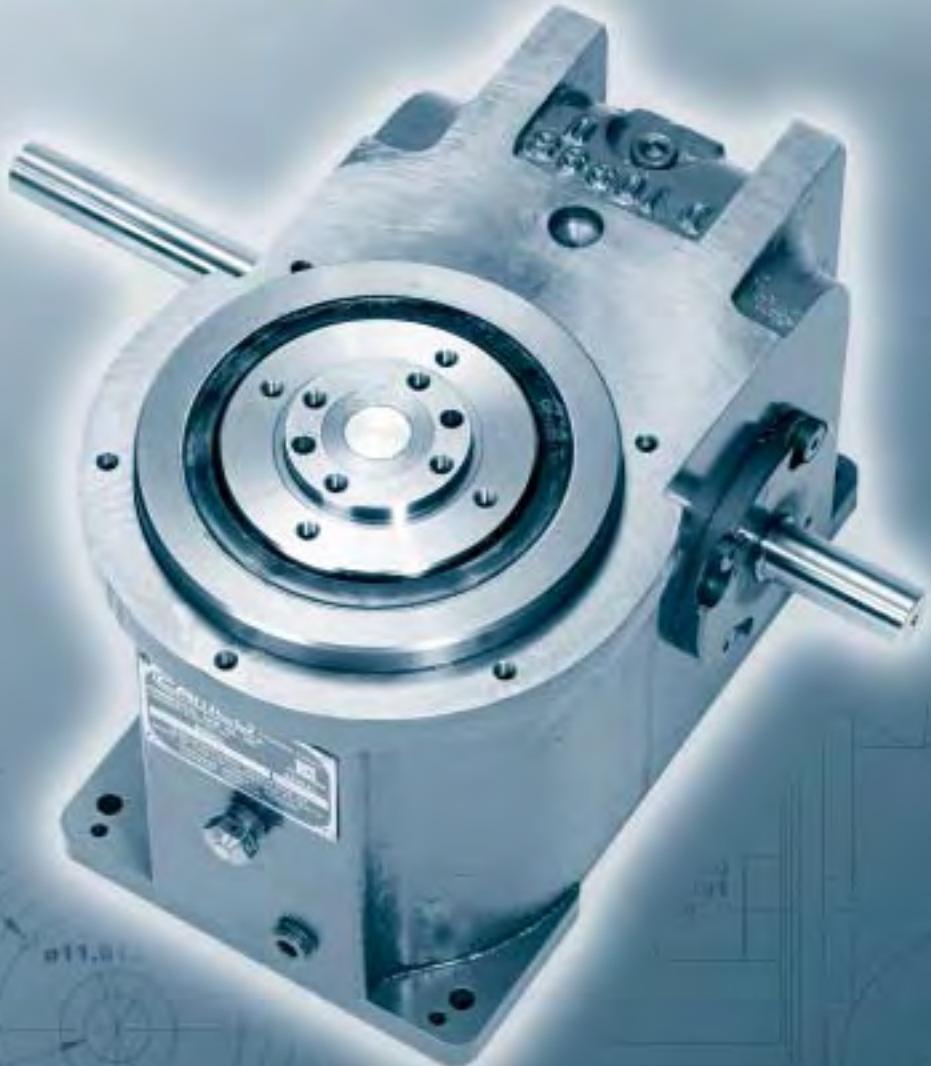

Reducer Ordering Procedure

1. Model
 2. Ratio
 - ◆ 5:1, 10:1, 15:1, 20:1, 25:1, 30:1, 40:1, 50:1, 60:1
 3. Motor Adapter
 4. Reducer Input Shaft Extension
 - ◆ Single Input (SE) or Double Input (DE)
 5. Mounting
 - ◆ Mounting Position A, B, C, or D
 - ◆ Mounted on Indexer Side 1 or Side 2
 6. Input Shaft Orientation
 - ◆ Left or Right (See Diagram Below)
- * Consult IMC for availability of this mounting

RD & Intermittor Index Drives

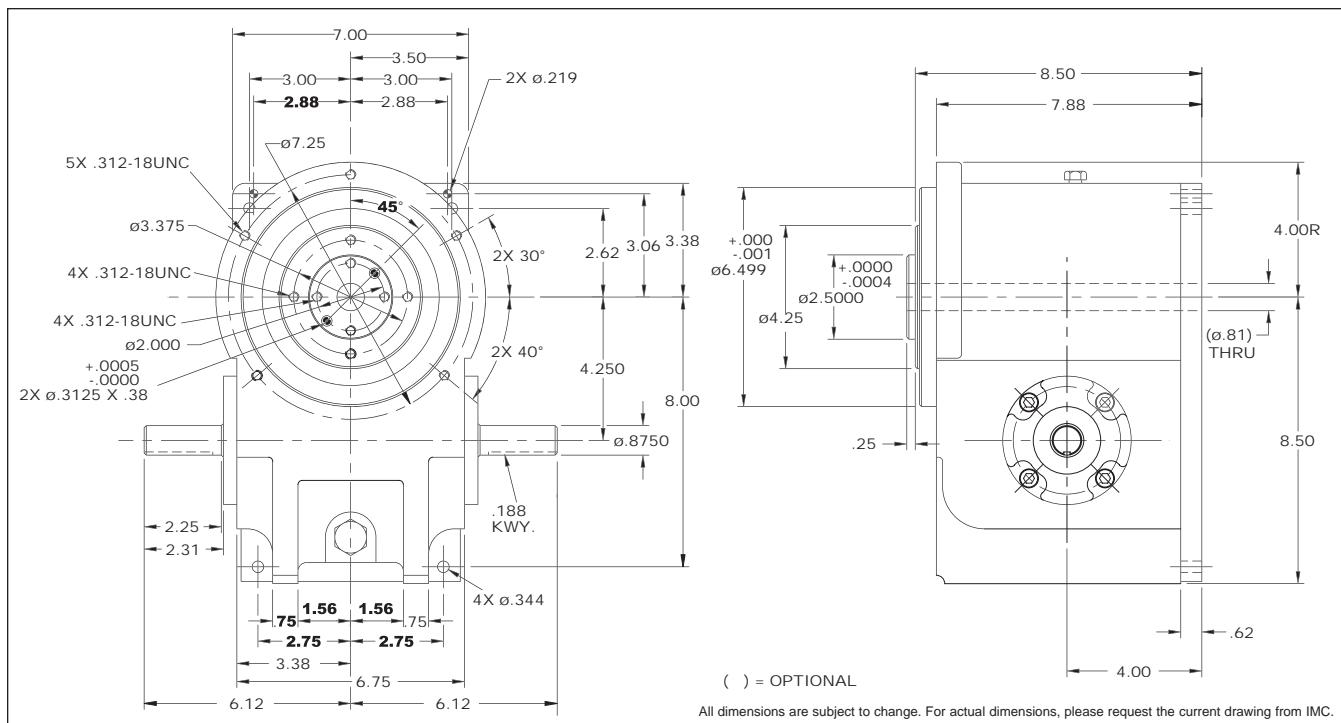

Features

IMC Roller Dial Index Drives offer superior load capabilities making them ideal for medium to high torque applications. Other features include:

- ◆ Short camshaft motion periods, due to oversized roller gear cam design, are well suited for continuous running applications or for special motion requirements such as oscillating motions.
- ◆ Universal mounting including a horizontal mounting ideal for trunion applications.
- ◆ Option Center Thru-Hole facilitates passage of electrical wiring, pneumatic lines or mechanical linkages.
- ◆ Optional Stationary Center Post with Thru Hole provides mounting for upper tool plate.

The RD and Intermittor Series Index Drives have a robust, flexible design with features ideal for continuous-running applications and applications requiring complex motions.

Technical Specifications**Output Load Capacity – loads carried during index**

Radial 2,700 lbs

Thrust/Axial 1,600 lbs

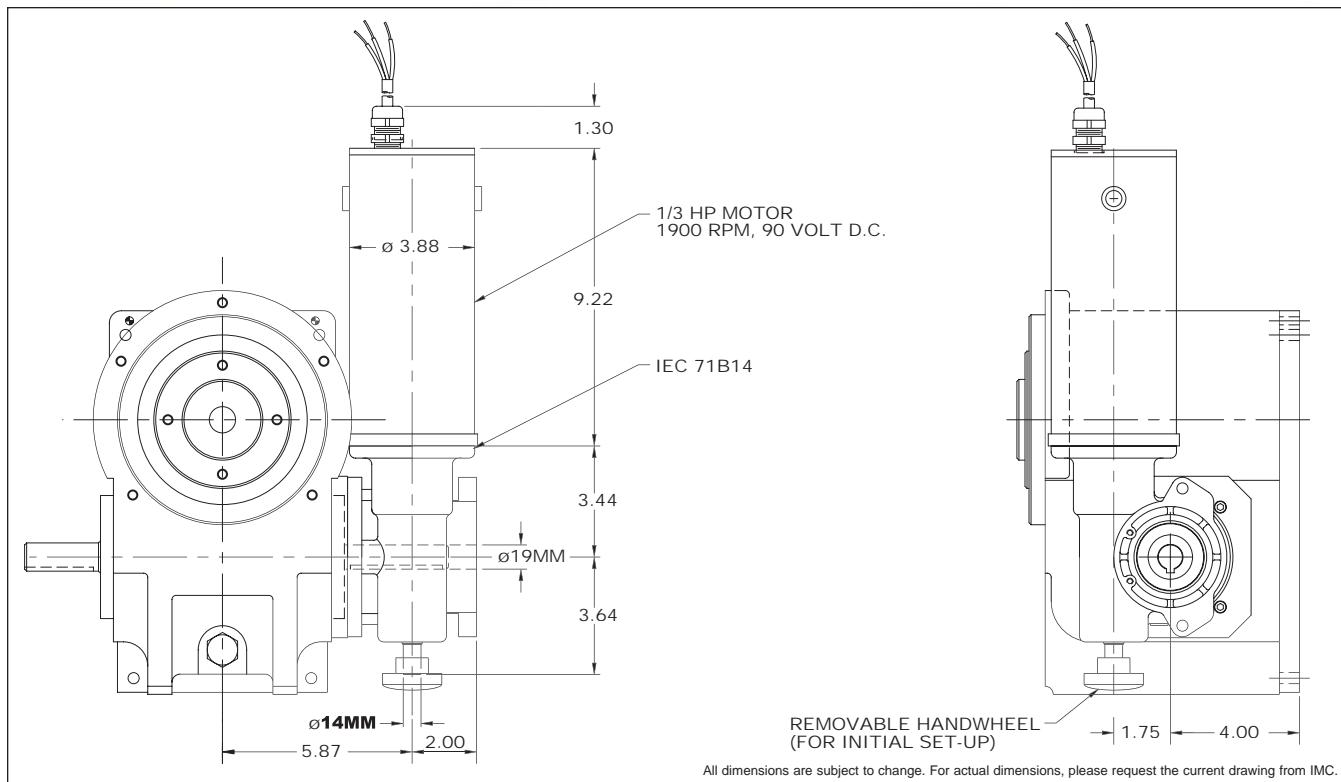

Moment 5,800 in.-lbs

Accuracy

±47 arcsec / ±.0027" at 12" Radius

Repeatability

±12 arcsec / ±.0007" at 12" Radius

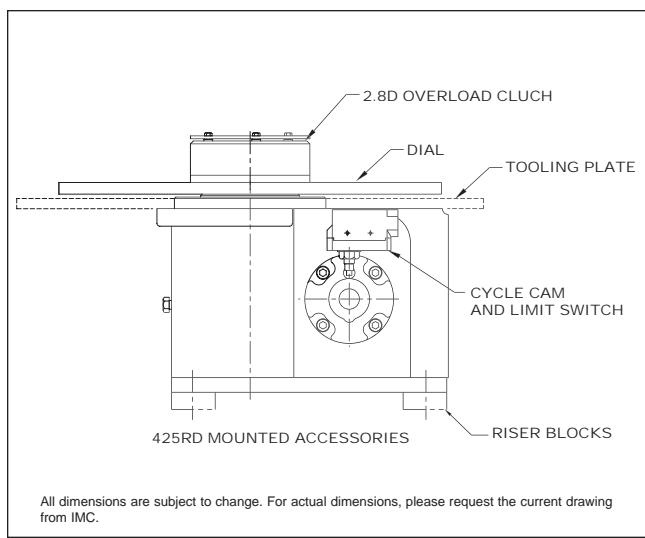

Standard Package

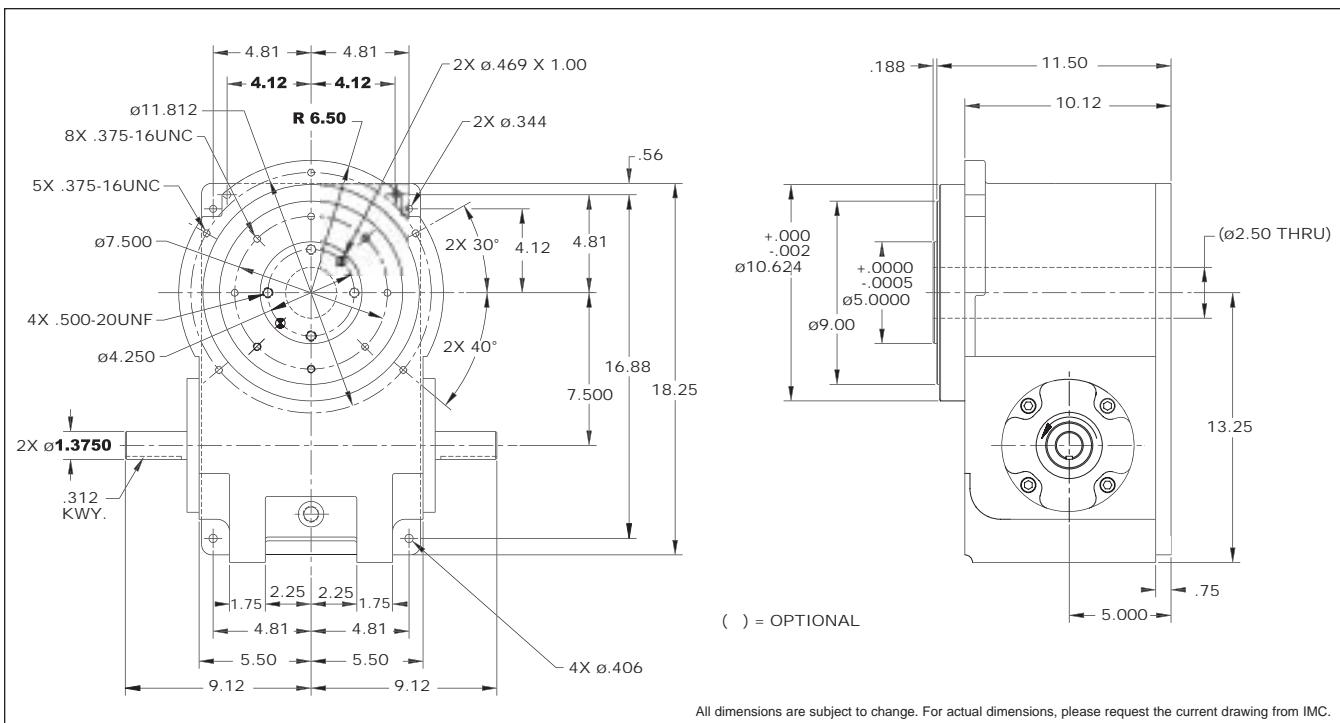

425RD Indexer with

- ◆ R180 Reducer (ratios from 5:1 to 60:1)
 - Double Extended Worm Shaft (Input)
 - Worm Shaft Handwheel
- ◆ Double Extended Camshaft (Input Shaft)
- ◆ 1/3 hp DC Motor
- ◆ Varipak DC Motor Control (up to 30 cpm)
- ◆ Cycle Cam and Limit Switch Mounted to Camshaft
- ◆ Right Hand Cam

Optional Accessories

- ◆ 1/3 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ R225 Reducer with 1 hp AC or DC Motor (ratios of 5:1 to 60:1)
- ◆ 2.8D Output Overload Clutch
 - Available Settings (in-lbs): 400, 480, 700, 850, 1100, 1300, 1800, 2200, 3100
- ◆ Center Thru Hole (0.81 in. Diameter)
- ◆ Stationary Center Post
- ◆ Dual Cam and Limit Switch
- ◆ Electric Clutch-Brake
- ◆ 180IOC or 225IOC Input OLC
- ◆ Left Hand Cam
- ◆ Relief in Dwell for shot-pin applications
- ◆ Universal Mounting Capability
- ◆ Custom Dial Plate

- ◆ Right Hand Cam

Optional Accessories

- ◆ 1.5 or 2 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ 2 hp DC motor
- ◆ R5 Reducer (Ratios from 5:1 to 60:1) with Motor Adapter and Coupling
- ◆ Center Thru Hole (2.00 in. Diameter)
- ◆ Stationary Center Post
- ◆ Dual Cam and Limit Switch
- ◆ Electric Clutch-Brake
- ◆ Air Clutch-Brake
- ◆ R4 or R5 FSC Input OLC
- ◆ Left Hand Cam
- ◆ Relief in Dwell for shot-pin applications
- ◆ Custom Dial Plate

Indexer Ordering Procedure

1. Model
2. Input Shaft Configuration
 - ◆ Side 1
 - ◆ Side 2
 - ◆ Double Input – DI (Standard)

3. Cam Lead (Helix)
 - ◆ Right Hand (Standard)
 - ◆ Left Hand

NOTE: Input may rotate in either direction to achieve desired direction of output rotation.

4. Indexer Mounting Position: 1-6

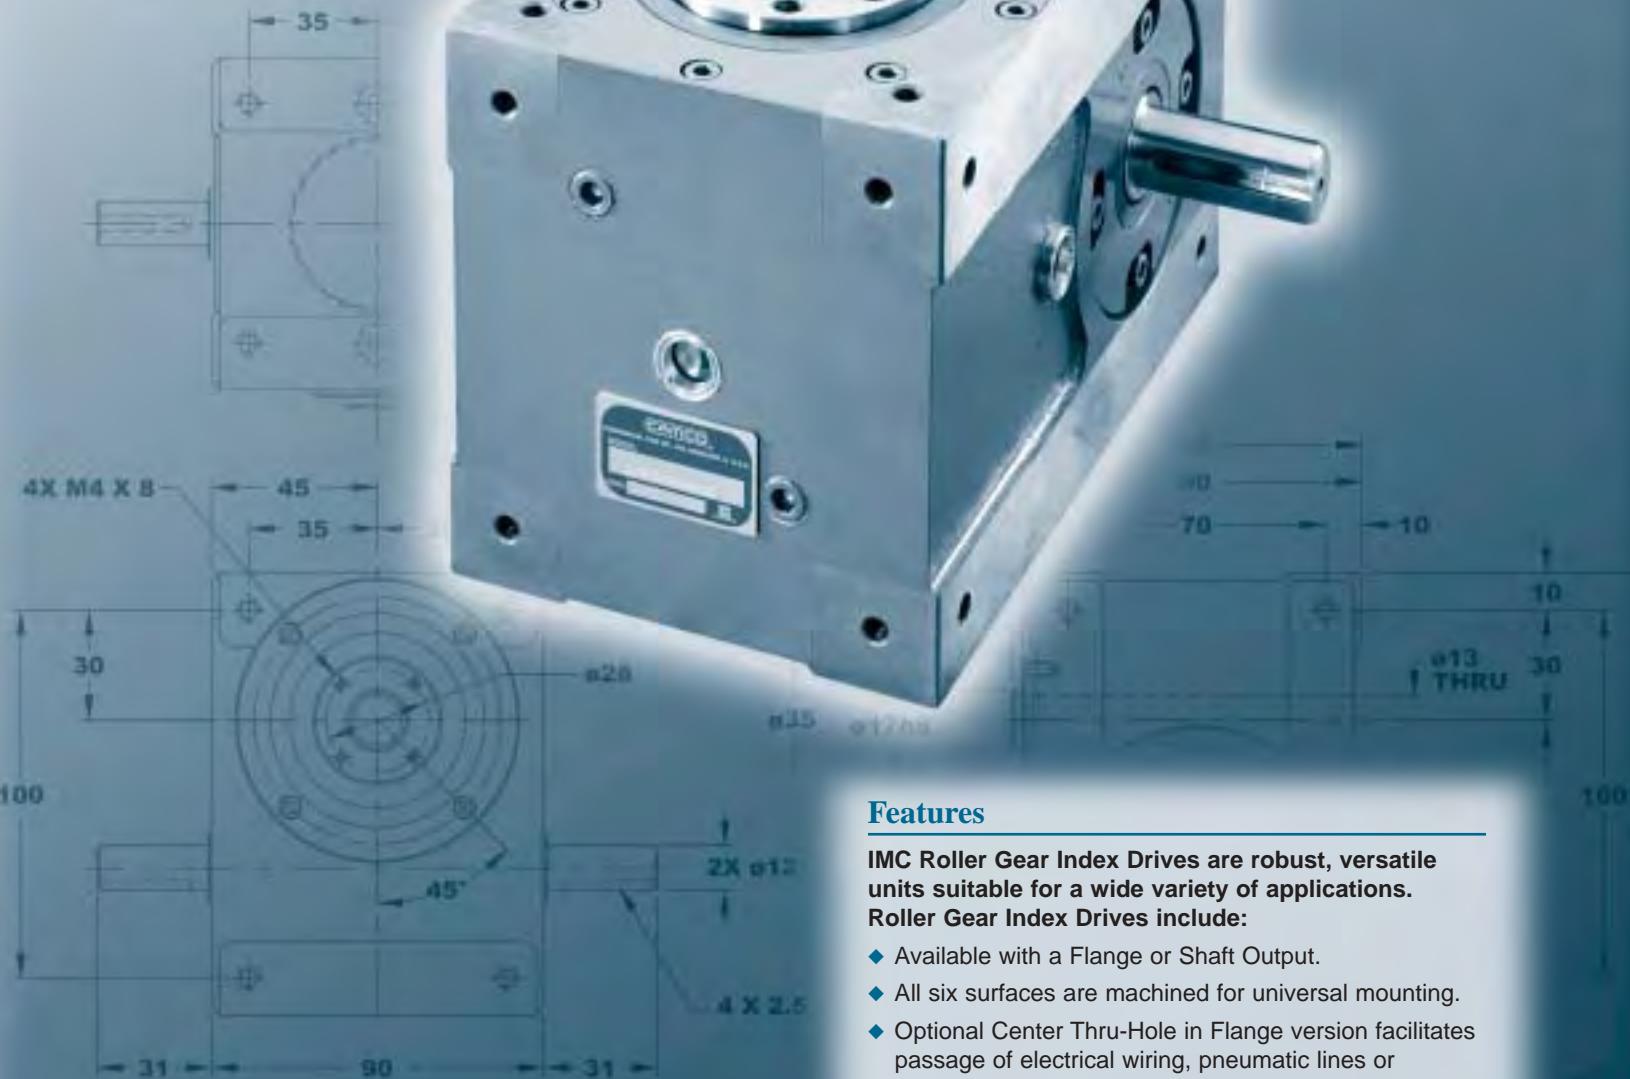

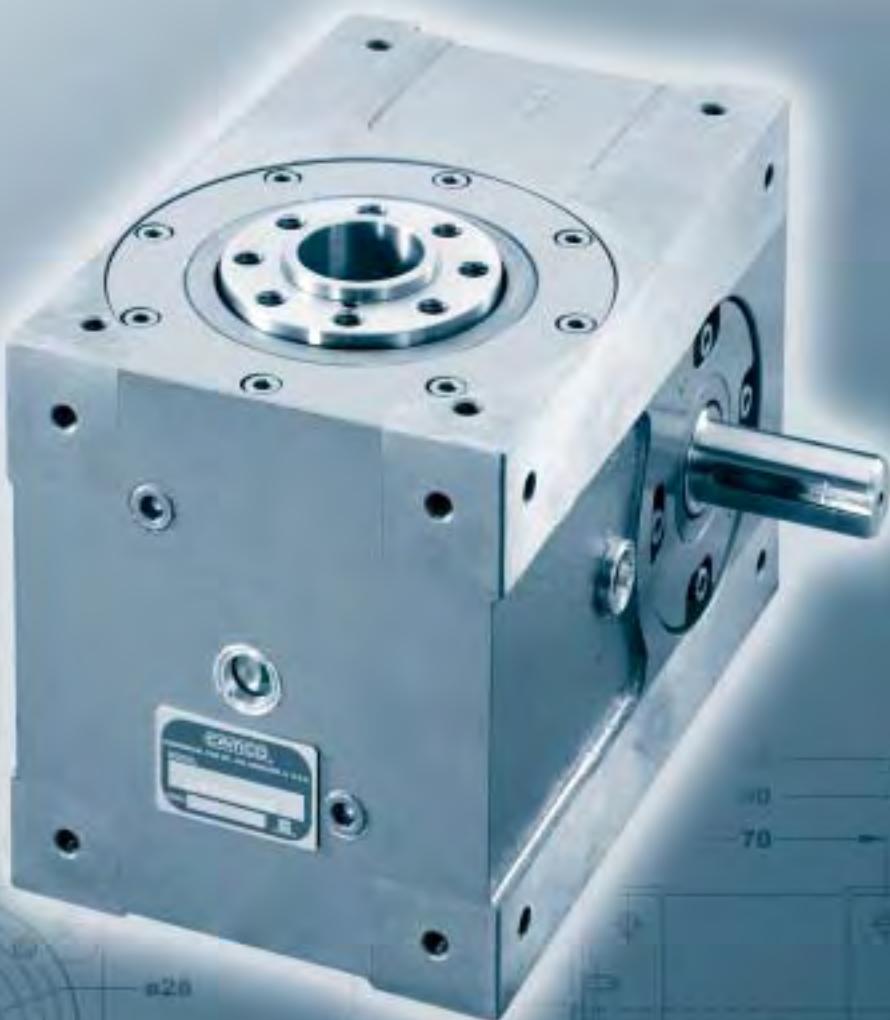

Position of Shafts		Indexer Mounting Position			
		1	2	3	4
Cam Lead					
Right Hand					
5					
		AE: Input Shaft		AS: Output Shaft	

Reducer Ordering Procedure

1. Model
 2. Ratio
 - ◆ 5:1, 10:1, 15:1, 20:1, 25:1, 30:1, 40:1, 50:1, 60:1
 3. Motor Adapter
 4. Reducer Input Shaft Extension
 - ◆ Single Input (SE) or Double Input (DE)
 5. Mounting
 - ◆ Mounting Position A, B, C, or D
 - ◆ Mounted on Indexer Side 1 or Side 2
 6. Input Shaft Orientation
 - ◆ Left or Right (See Diagram Below)
- * Consult IMC for availability of this mounting

Reducer Mounting Position							

Roller Gear Index Drives

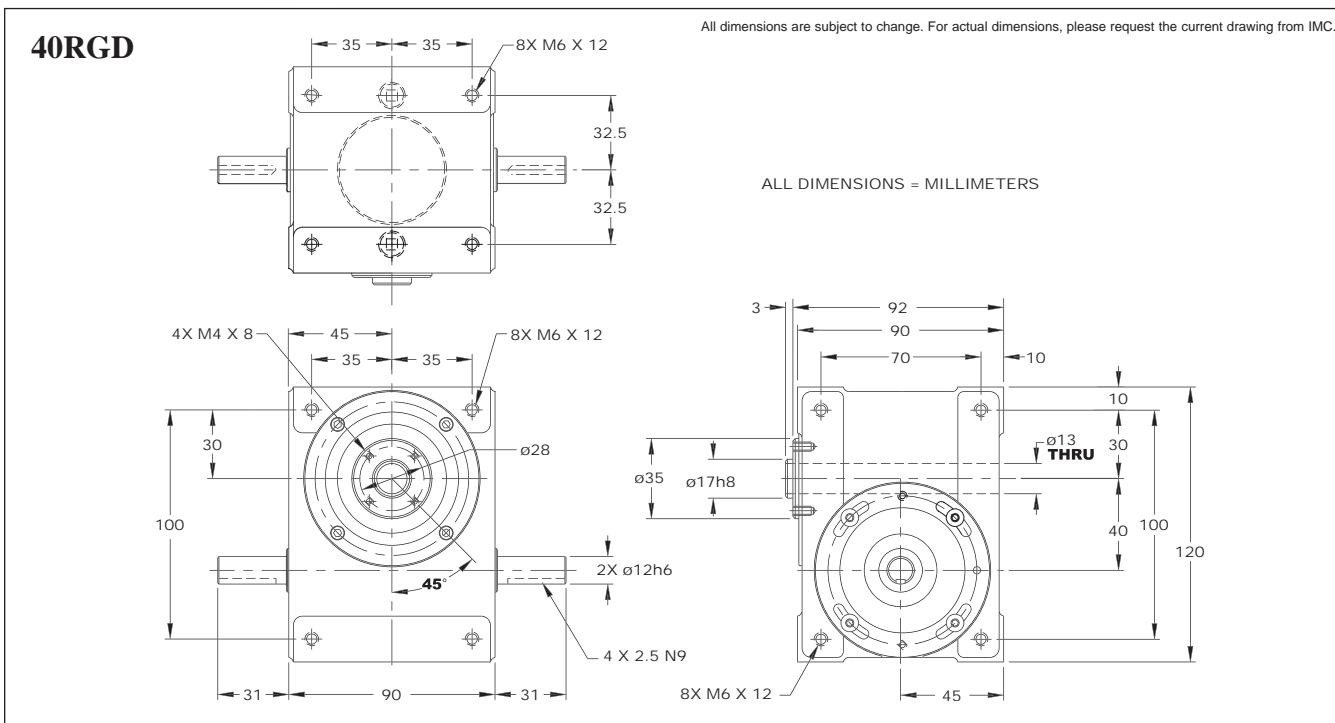

Features

IMC Roller Gear Index Drives are robust, versatile units suitable for a wide variety of applications. Roller Gear Index Drives include:

- ◆ Available with a Flange or Shaft Output.
- ◆ All six surfaces are machined for universal mounting.
- ◆ Optional Center Thru-Hole in Flange version facilitates passage of electrical wiring, pneumatic lines or mechanical linkages.
- ◆ Short camshaft motion periods, due to oversized cam design, are well suited for continuous running applications or for special motion requirements such as oscillating motions.

Roller Gear Index Drives are available in 14 models to meet a wide variety of speed, load and space requirements.

Standard Features

- ◆ Universal Mounting: mounting holes on any of 6 sides
- ◆ Right Hand Cam Standard
- ◆ Center Through Hole (.75 in. Diameter) in RGD version.

Accessories and Options

- ◆ R180 Reducer (Ratios from 5:1 to 60:1)
 - 1/3 hp DC Motor with Varipak DC Motor Control (up to 30 cpm)
 - 1/3 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ R225 Reducer (Ratios from 5:1 to 60:1)
 - 56C Motor Adapter and Coupling
 - 1 hp DC Motor with Varipak DC Motor Control (up to 30 cpm)
 - 1 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ Single or Dual Cycle Cam and Limit Switch
- ◆ Output Overload Clutch Models: 2.3F, 2.3FC, 2.3S and 2.3C
 - Settings (in-lbs): 400, 600, 700, 850, 1000, 1300, 1800, 2000, 2300
- ◆ Relief in Dwell for shot-pin applications
- ◆ Electric Clutch-Brake
- ◆ Air Clutch-Brake (with R225 Reducer only)
- ◆ Left Hand Cam
- ◆ Relief in Dwell for shot-pin applications

Sentry Series: Internal Torque Limiter

In addition to the standard Roller Gear series features, the **Sentry Series Index Drives** incorporate the **patented Internal Torque Limiter**, available only from IMC, as a standard feature. The advantages of the Internal Torque Limiter include:

- ◆ **Ideal for Harsh Environments.** Dusty, dirty, humid and washdown environments do not reduce indexer or machine performance due to the Sentry Series totally enclosed design.
- ◆ **Provides For Overload Protection.** The Sentry Series recognizes machine jams and disengages the drive. This reduces downtime, eliminates the need for costly spare parts, prolongs indexer life, improves output and increases productivity.

- ◆ **Reduces Assembly Time.** External clutches or torque limiters require an additional alignment operation and add overall tolerances to placement accuracy. With the addition of an Internal Torque Limiter, the time required for installation has been significantly reduced.
- ◆ **Self Lubricating.** The clutch is housed in an oil bath with no additional lubrication needed. An optional lubrication monitoring system signals host computers when oil is low or abnormally high in temperature.

Sentry Series: Internal Torque Limiter

Indexer Ordering Procedure

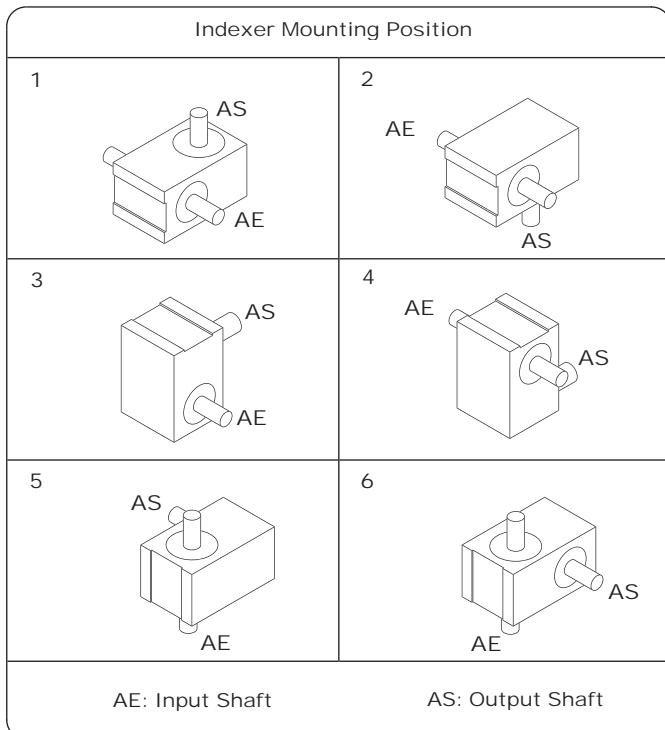

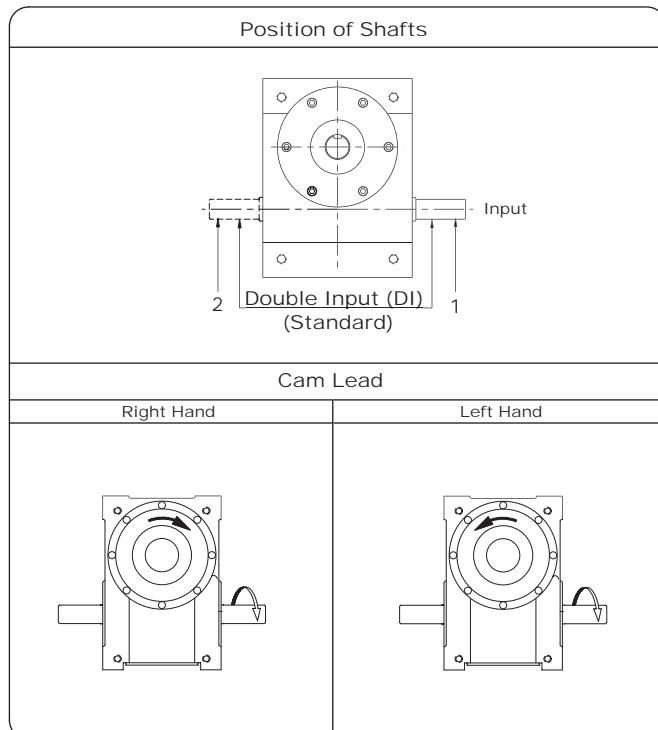

1. Model
2. Input Shaft Configuration
 - ◆ Side 1
 - ◆ Side 2
 - ◆ Double Input – DI (Standard)

3. Cam Lead (Helix)

- ◆ Right Hand (Standard)
- ◆ Left Hand

NOTE: Input may rotate in either direction to achieve desired direction of output rotation.

4. Indexer Mounting Position: 1-6

Reducer Ordering Procedure

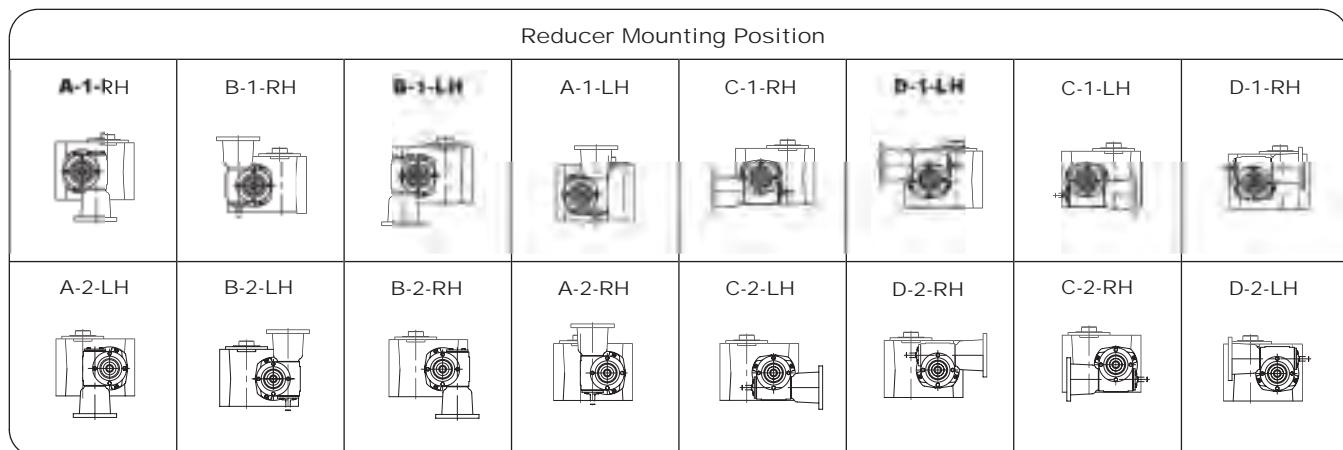

1. Model
2. Ratio
 - ◆ 5:1, 10:1, 15:1, 20:1, 25:1, 30:1, 40:1, 50:1, 60:1
3. Motor Adapter
4. Reducer Input Shaft Extension
 - ◆ Single Input (SE) or Double Input (DE)

5. Mounting

- ◆ Mounting Position A, B, C, or D
- ◆ Mounted on Indexer Side 1 or Side 2

6. Input Shaft Orientation

- ◆ Left or Right (See Diagram Below)

Parallel Index Drives

Features

IMC Parallel Index Drives are ideal for high-speed applications or for actuation-type applications such as driving a linkage or a conveyor. Parallel Index Drive features include:

- ◆ Hardened and ground conjugate cams
- ◆ Yoke-mounted, preloaded cam followers are non-reversing for high capacity and speed capability
- ◆ Whole or fractions stops, oscillating and complex custom motions are available
- ◆ Long Transfer Distances achieved with simple linkages.
- ◆ Preloaded, tapered roller bearings for rigidity and backlash-free operation.

Standard Package

250P Indexer with

- ◆ Single Input Shaft and Single Output Shaft
- ◆ Output horizontal even with input Mounting
- ◆ R180 Reducer (ratios from 5:1 to 60:1)
 - Double Extended Worm (input) Shaft
 - Worm Shaft Handwheel
- ◆ 1/3 hp DC motor
- ◆ Varipak DC Motor Control (up to 30 cpm)
- ◆ Single Cycle Cam and Limit Switch

Accessories and Options

- ◆ 1/3 or 1 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ R225 Reducer (ratios from 5:1 to 60:1)
 - 1 hp AC or DC drive package
 - 56C Motor Adapter and Coupling
- ◆ Output Overload Clutch Models: .39F, .39FC, .39S and .39C, .39C-SD, .39FC-SD, .39S-SD
 - Available Settings (in-lb): 160, 210, 270, 320, 390
- ◆ Dual Cycle Cam and Limit Switch
- ◆ Electric Clutch-Brake
- ◆ Air Clutch-Brake (with R225 only)
- ◆ Oscillating motion
- ◆ Double Input Shaft
- ◆ Double Output Shaft
- ◆ Output and Input Vertical Mounting
- ◆ 180-IOC or 225-IOC Input Overload Clutch

Technical Specifications**Output Load Capacity – loads carried during index**

Radial 1,627 lbs

Thrust/Axial 577 lbs

Moment 2,945 in.-lbs

Accuracy ±50 arcsec / ±.0007" at 3" Radius**Repeatability** ±25 arcsec / ±.0004" at 3" Radius

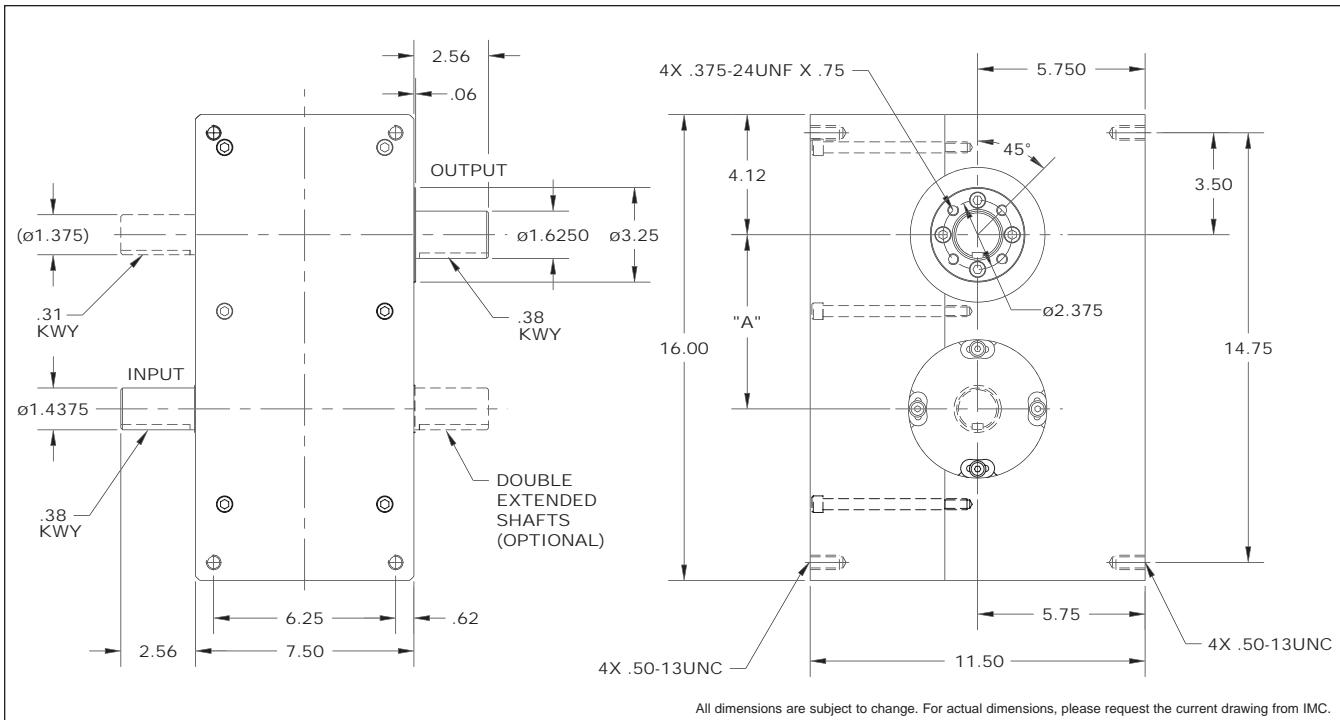

Standard Package

387P Indexer with

- ◆ Single Input Shaft and Single Output Shaft
- ◆ Output horizontal even with input Mounting
- ◆ R225 Reducer (ratios from 5:1 to 60:1)
 - 56C Motor Adapter and Coupling
- ◆ 1 hp DC motor
- ◆ Varipak DC Motor Control (up to 30 cpm)
- ◆ Single Cycle Cam and Limit Switch

Accessories and Options

- ◆ 1 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ R260 Reducer (ratios from 5:1 to 60:1)
 - 1 hp AC or DC drive package
 - 56C Motor Adapter and Coupling
- ◆ Output Overload Clutch Models: 2.3F, 2.3FC, 2.3S and 2.3C, 2.3C-SD, 2.3FC-SD, 2.3S-SD
 - Available Settings (in-lb): 400, 600, 700, 850, 1000, 1300, 1800, 2000, 2300
- ◆ Dual Cycle Cam and Limit Switch
- ◆ Electric Clutch-Brake
- ◆ Air Clutch-Brake
- ◆ Oscillating motion
- ◆ Double Input Shaft
- ◆ Double Output Shaft
- ◆ Output and Input Vertical Mounting
- ◆ 225-IOC or 260-IOC Input Overload Clutch

Technical Specifications

Output Load Capacity – loads carried during index

Radial 2,485 lbs

Thrust/Axial 129 lbs

Moment 9,940 in.-lbs

Accuracy ±50 arcsec / ±.0007" at 3" Radius

Repeatability ±24 arcsec / ±.0003" at 3" Radius

Standard Package

P500 Indexer with

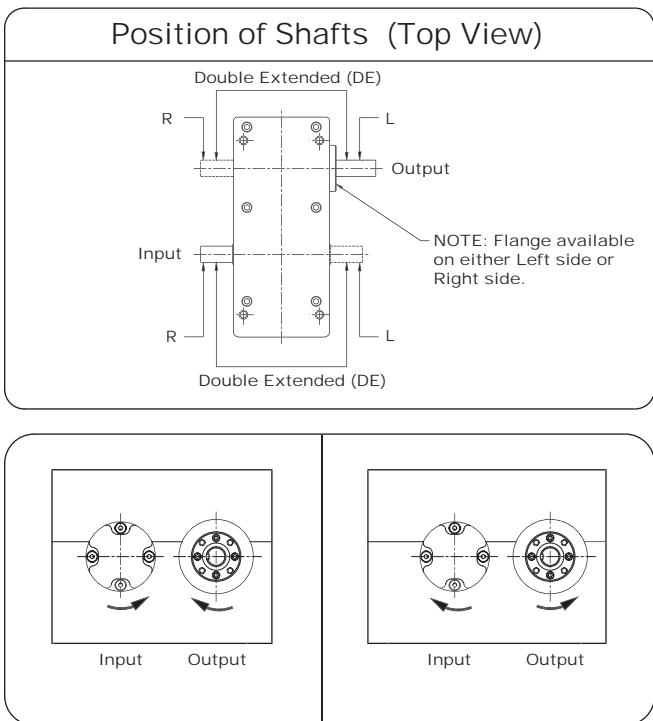

- ◆ Single Input Shaft and Single Output Shaft
- ◆ Output horizontal even with input Mounting
- ◆ 6SFM Reducer (ratios from 5:1 to 60:1)
 - 56C Motor Adapter and Coupling
- ◆ 1 hp DC motor
- ◆ Varipak DC Motor Control (up to 30 cpm)
- ◆ Single Cycle Cam and Limit Switch

Accessories and Options

-
- ◆ 1 or 1.5 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
 - ◆ Output Overload Clutch Models: RT6 S/S, RT6 S/F
 - Available Settings, Adjustable Ranges (in-lb): 1000-2700, 2500-5000, 4000-8500
 - ◆ Dual Cycle Cam and Limit Switch
 - ◆ Electric Clutch-Brake
 - ◆ Air Clutch-Brake
 - ◆ Oscillating motion
 - ◆ Double Input Shaft
 - ◆ Double Output Shaft
 - ◆ Output and Input Vertical Mounting

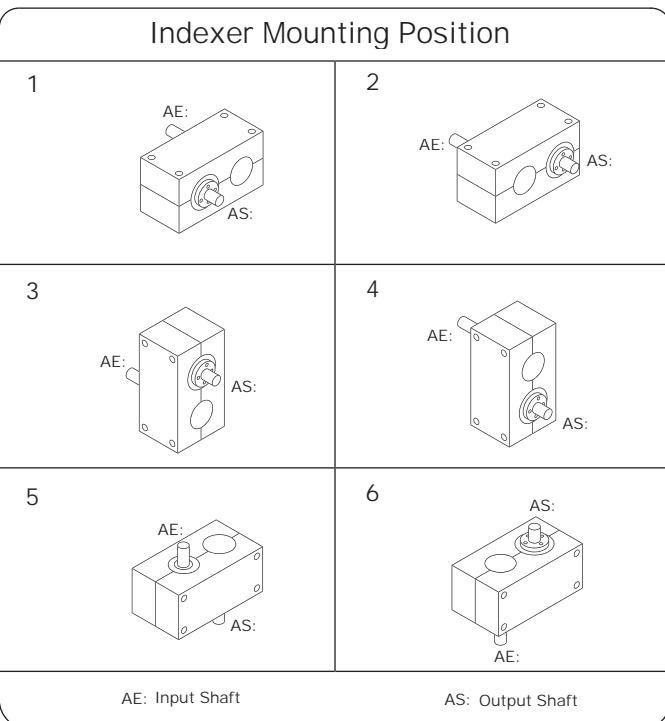

Indexer Ordering Procedure

1. Input Assembly: Right, Left or Double (DE)
2. Output Assembly: Right, Left or Double (DE).
 - ◆ Flanged output is primary output. For Double Output, specify whether flanged output is on right or left side.

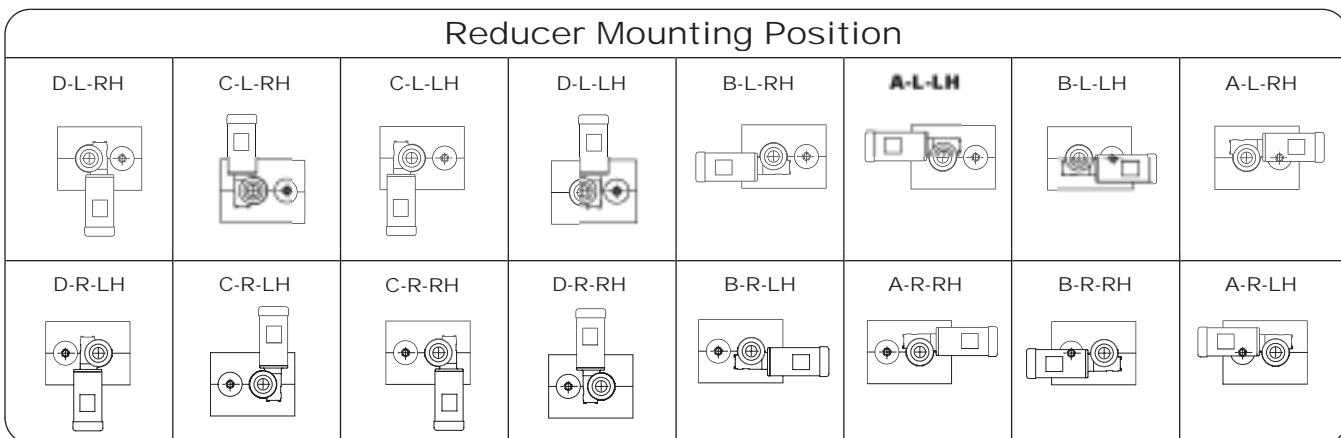

NOTE: Input may rotate in either direction to achieve desired direction of output rotation.

3. Mounting Position: 1-6

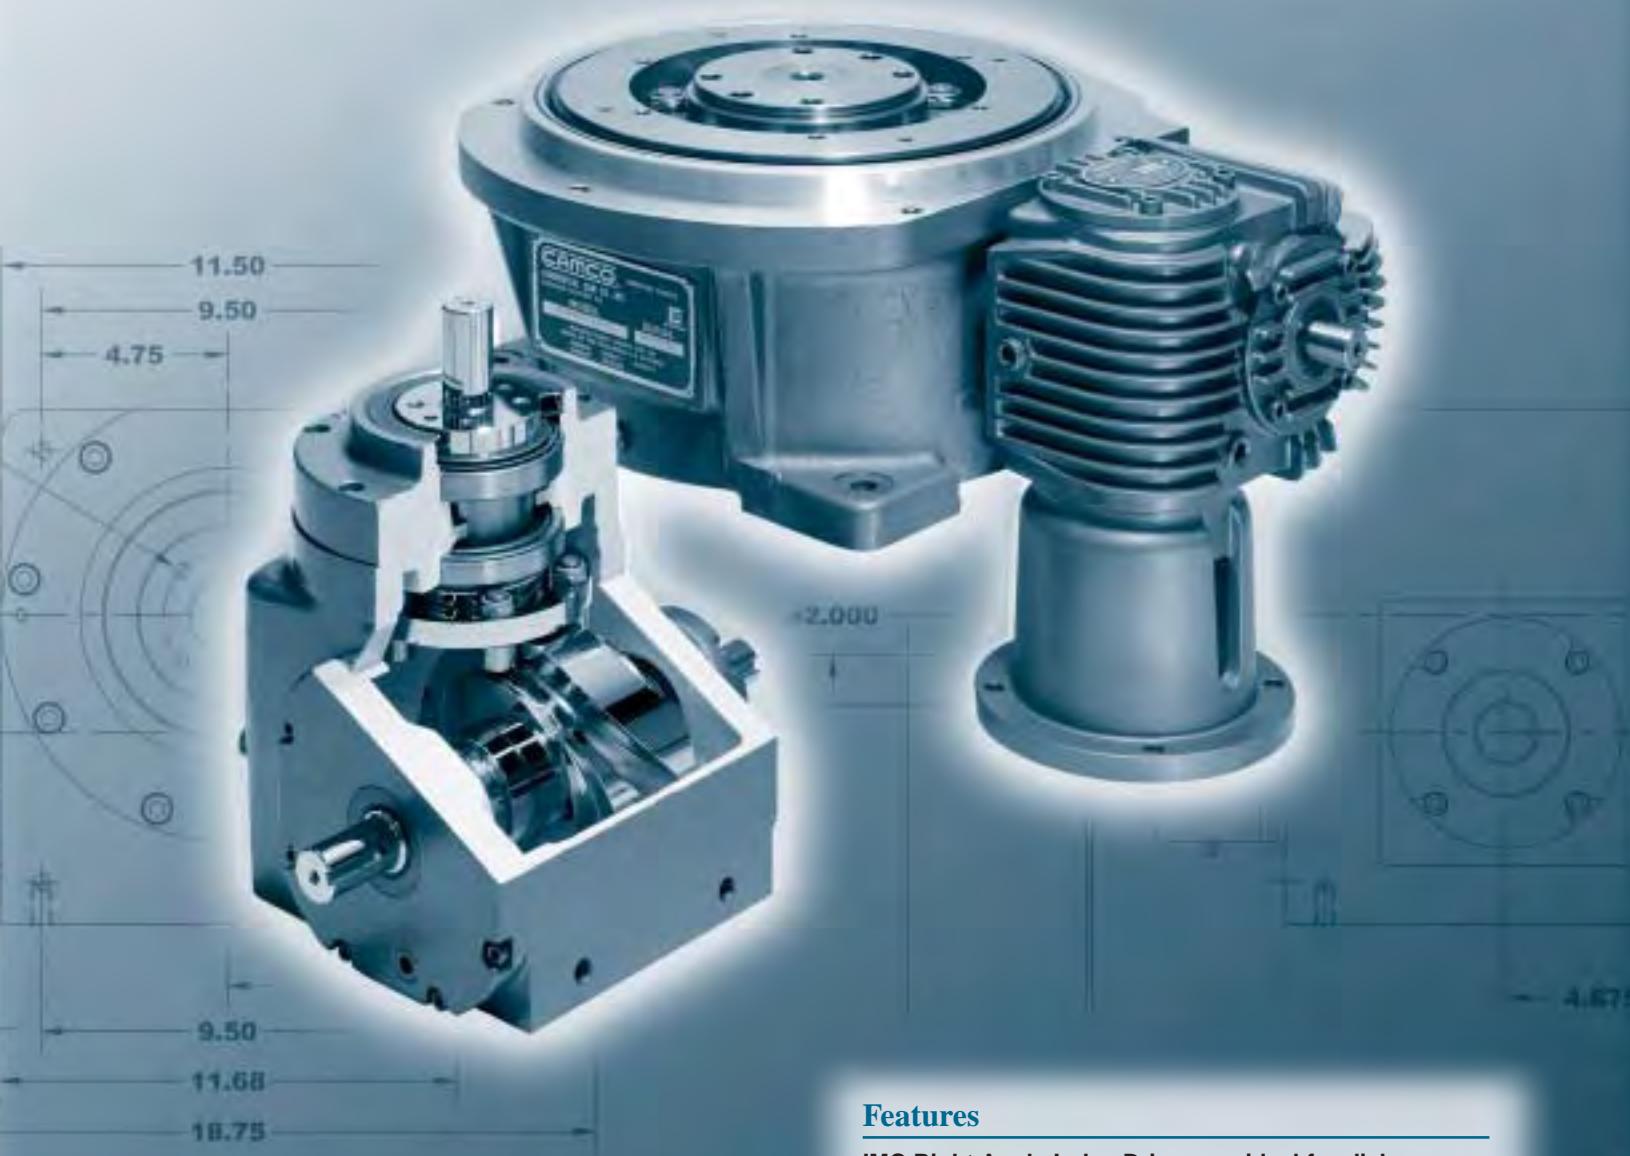

Reducer Ordering Procedure

1. Model
2. Ratio: 5:1, 10:1, 15:1, 20:1, 25:1, 30:1, 40:1, 50:1, 60:1
3. Motor Adapter
4. Reducer Input Shaft Extension: Single Input (SE) or Double Input (DE)
5. Mounting (see diagram below)

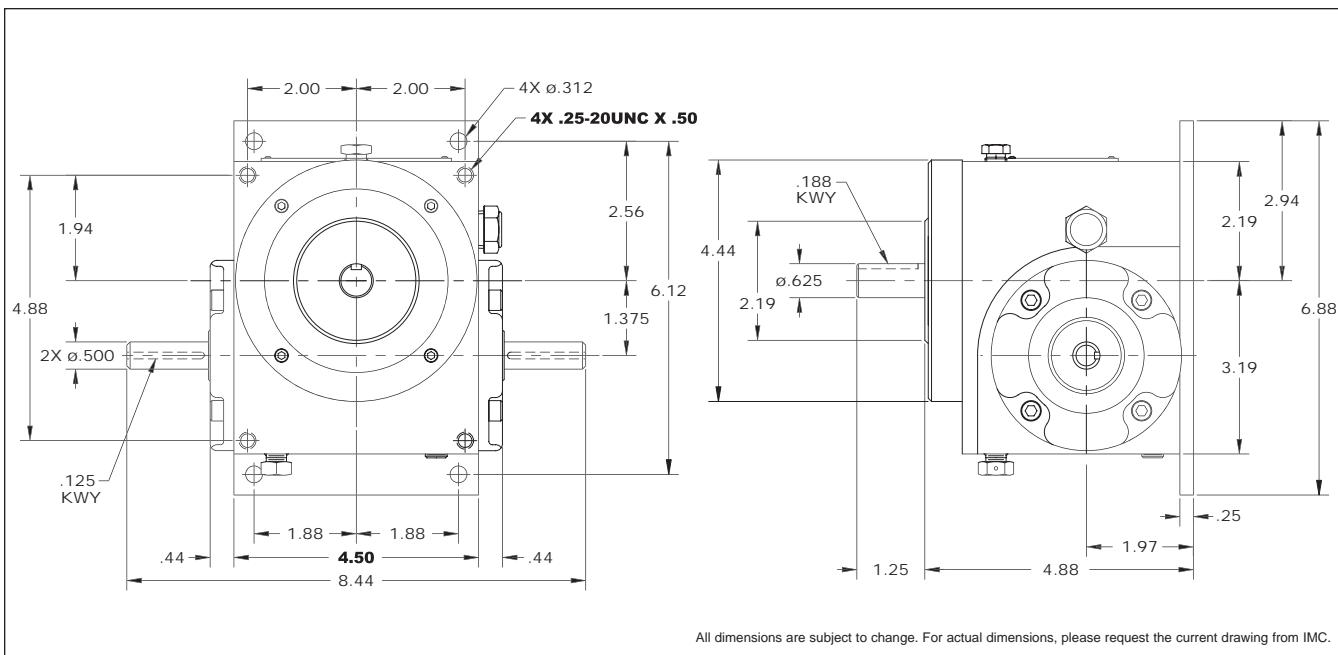

Right Angle Index Drives

Features

IMC Right Angle Index Drives are ideal for dial applications or actuation-type applications such as driving a linkage or in-line conveyor. Right Angle Index Drives feature:

- ◆ Fixed Center Distance between input and output
- ◆ Hardened, ground barrel cam
- ◆ Flanged-Shaft or Dial Output
- ◆ Compact Design requiring minimum use of floor space.
- ◆ Preloaded "rib-centered" design with Modified Sine motion provides smooth acceleration and deceleration with precision positioning.
- ◆ Universal mounting available on RA models.
- ◆ Center Thru-Hole in RAD models facilitates passage of electrical wiring, pneumatic lines or mechanical linkages.

Technical Specifications**Output Load Capacity – loads carried during index**

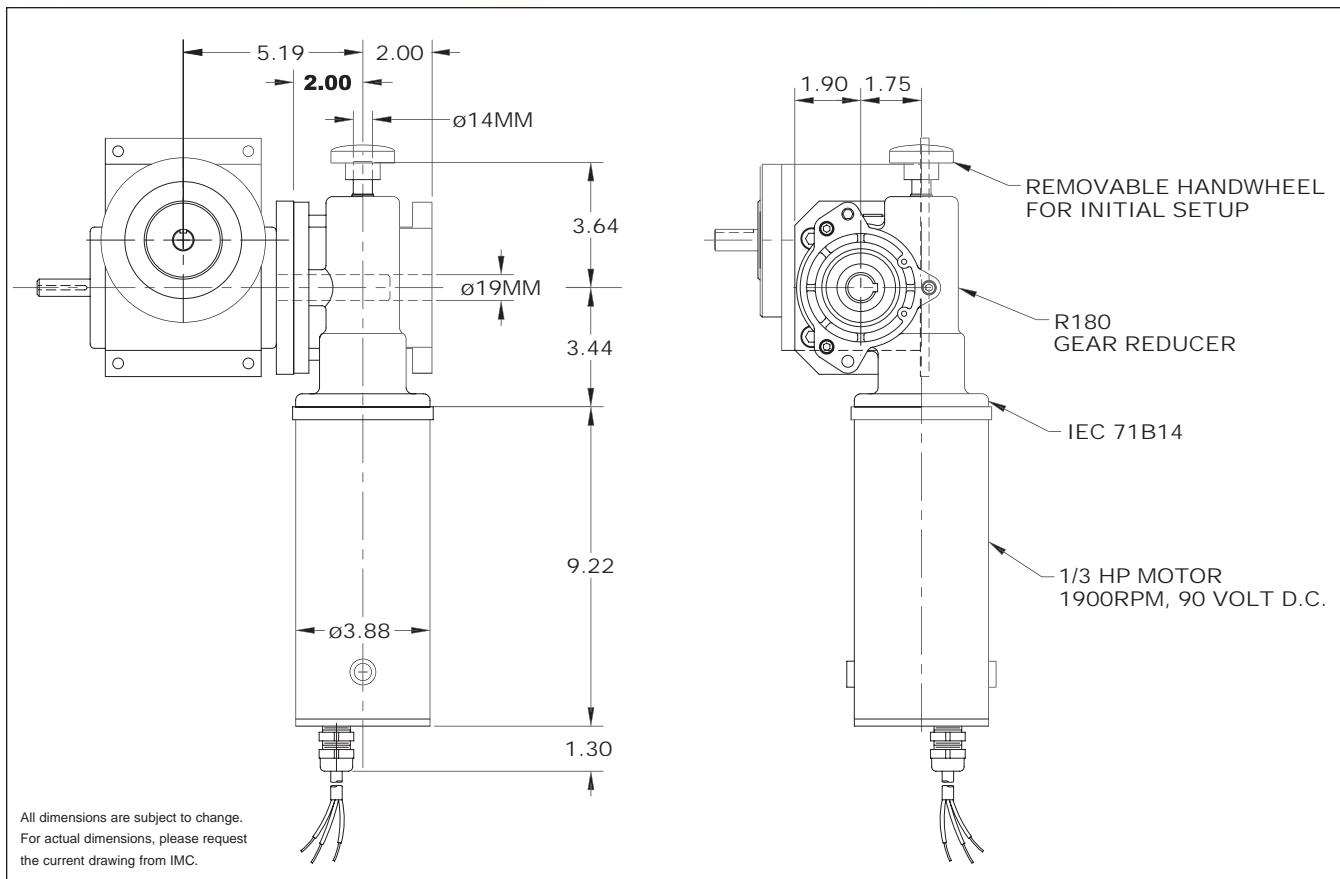

Radial 575 lbs

Thrust/Axial 577 lbs

Moment 719 in.-lbs

Accuracy ±67 arcsec / ±.0010" at 3" Radius

Repeatability ±33 arcsec / ±.0005" at 3" Radius

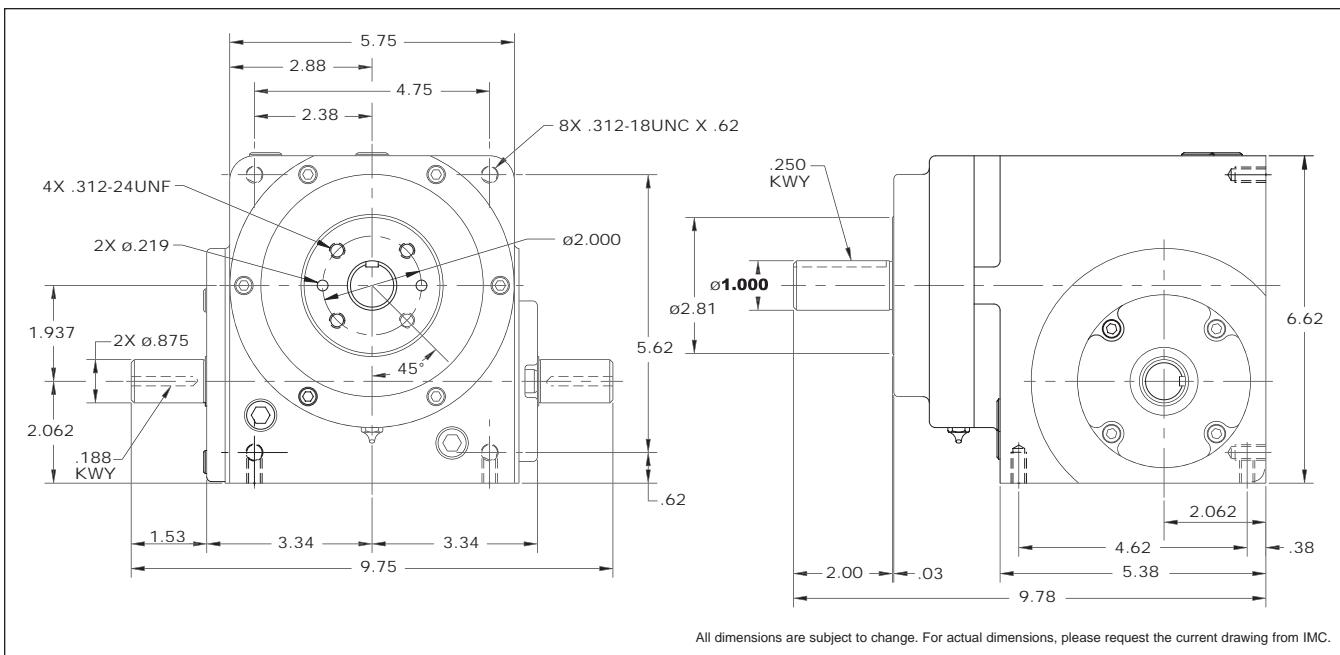

Standard Package

301RA with

- ◆ R180 Reducer (ratios from 5:1 to 60:1)
 - Double Extended Worm Shaft (Input)
 - Worm Shaft Handwheel
- ◆ Double Extended Camshaft (Input Shaft)
- ◆ 1/3 hp DC motor
- ◆ Varipak DC Motor Control (up to 30 cpm)
- ◆ Cycle Cam and Limit Switch Mounted to Camshaft
- ◆ Right Hand Cam

Accessories and Options

- ◆ 1/3 or 1 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ Output Overload Clutch Models: .39F, .39FC, .39S, .39C, .39FC-SD, .39S-SD, .39C-SD
 - Available Settings (in-lb): 160, 210, 270, 320, 390
- ◆ Dual Cycle Cam and Limit Switch
- ◆ Finished cover for ceiling mount or tooling plate mounting
- ◆ Electric Clutch-Brake
- ◆ Left Hand Cam
- ◆ Relief in Dwell for shot-pin applications

Technical Specifications**Output Load Capacity – loads carried during index**

Radial 7110 lbs

Thrust/Axial 4138 lbs

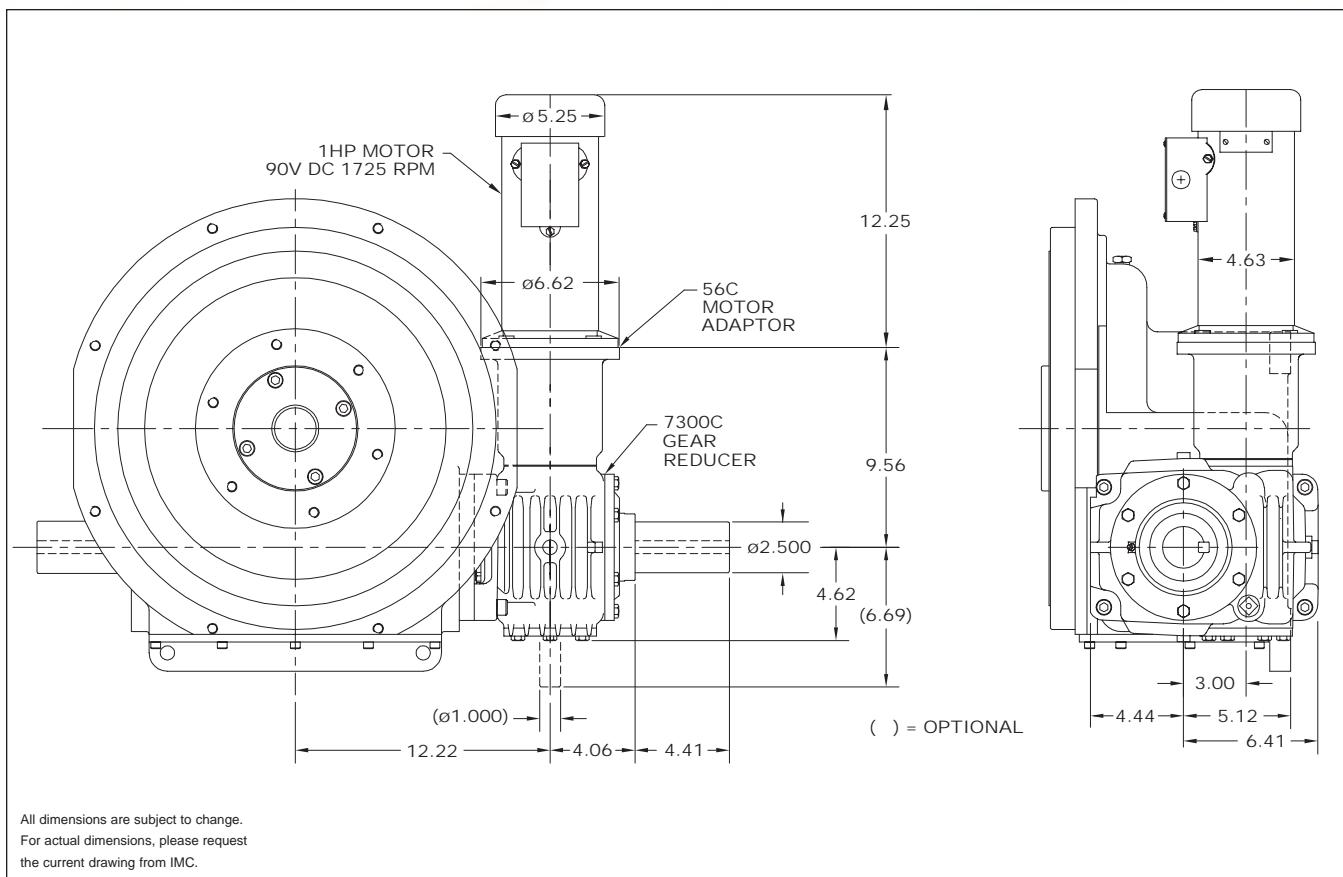

Moment 60,438 in.-lbs

Accuracy

±20 arcsec / ±.0006" at 6" Radius

Repeatability

±10 arcsec / ±.0003" at 6" Radius

Standard Package

1200RAD with

- ◆ 7300C Reducer (ratios from 5:1 to 60:1)
 - Motor Adapter and Coupling
- ◆ 1 hp DC motor
- ◆ Varipak DC Motor Control (up to 30 cpm)

- ◆ Cycle Cam and Limit Switch Mounted to Camshaft
- ◆ Center Through Hole (2.00 in. Diameter)
- ◆ Double Extended Camshaft (Input Shaft)
- ◆ Right Hand Cam

Accessories and Options

- ◆ 1 or 2 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ 7350C Reducer (ratios from 5:1 to 60:1)
 - Motor Adapter and Coupling
- ◆ 2 hp DC Motor with Varipak DC Motor Control (up to 30 cpm)
- ◆ Output Overload Clutch Model: 31D
 - Available Settings (in-lb): 8500, 13,000, 20,000, 31,000

- ◆ Dual Cycle Cam and Limit Switch
- ◆ Finished cover for ceiling mount or tooling plate mounting
- ◆ Electric Clutch-Brake
- ◆ Air Clutch-Brake
- ◆ Left Hand Cam
- ◆ Relief in Dwell for shot-pin applications
- ◆ 300-IOC or 350-IOC Input Overload Clutch

Indexer Ordering Procedure

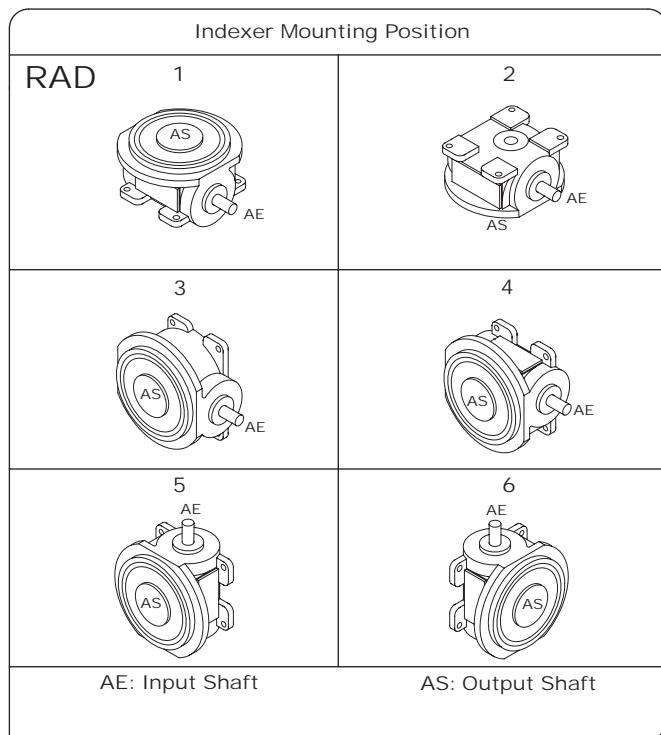

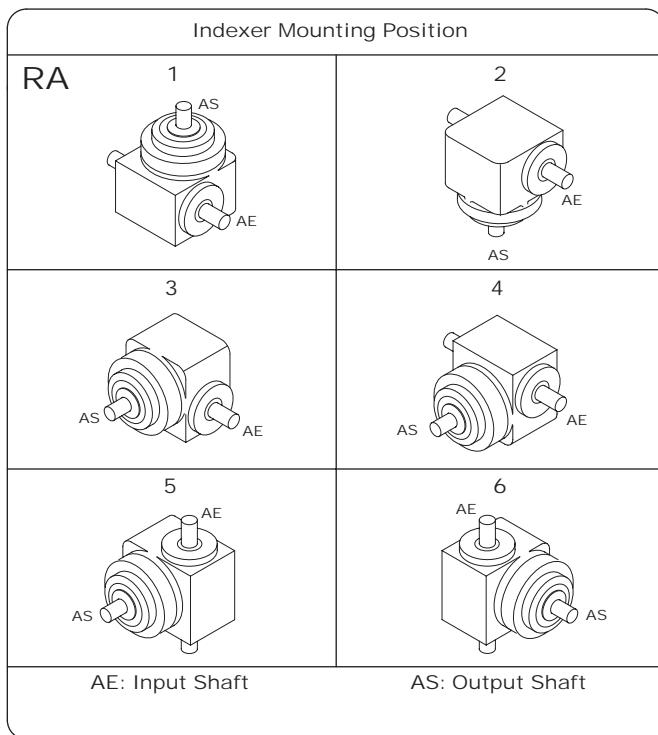

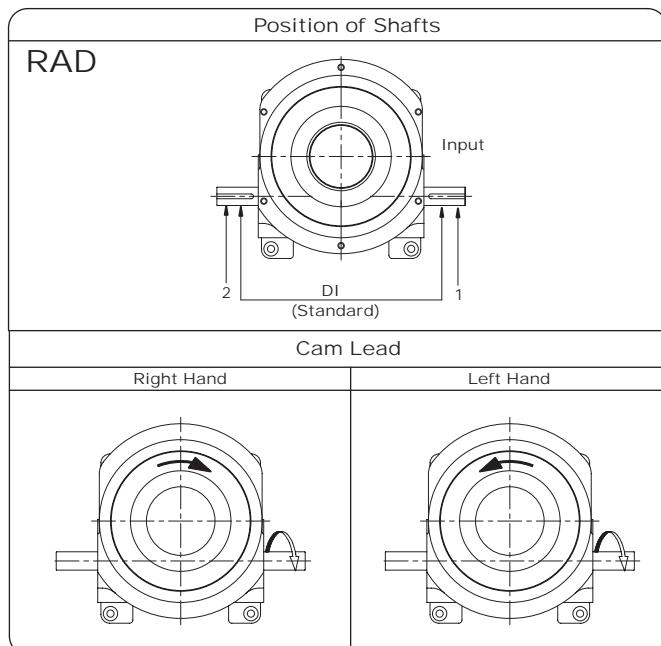

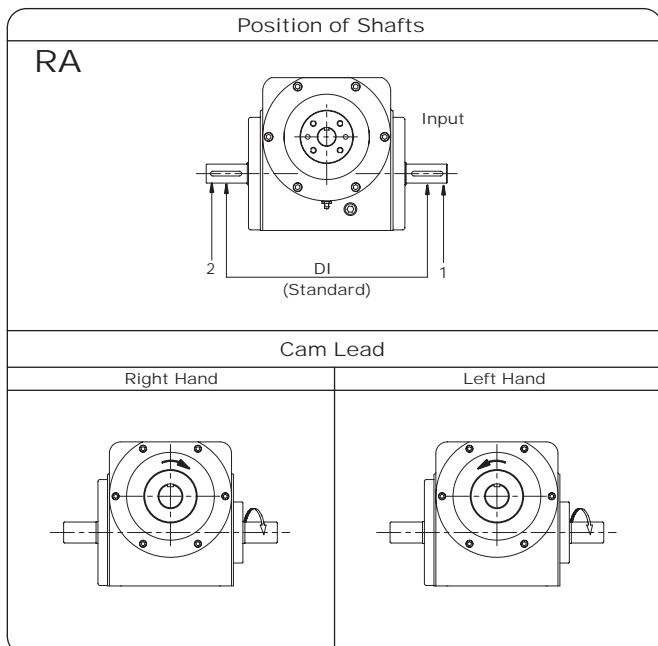

1. Model
2. Input Shaft Configuration
 - ◆ Side 1
 - ◆ Side 2
 - ◆ Double Input – DI (Standard)

3. Cam Lead (Helix)

- ◆ Right Hand (standard)
- ◆ Left Hand

NOTE: Input may rotate in either direction to achieve desired direction of output rotation

4. Indexer Mounting Position: 1-6

Reducer Ordering Procedure

1. Model
2. Ratio: 5:1, 10:1, 15:1, 20:1, 25:1, 30:1, 40:1, 50:1, 60:1
3. Motor Adapter
4. Reducer Input Shaft Extension: Single Input (SE) or Double Input (DE)
5. Mounting (see diagram below)

Reducer Mounting Position

* Consult IMC for availability of this mounting on RAD models

Right Angle Index Drives

F

Heavy Duty E-Series Index Drives

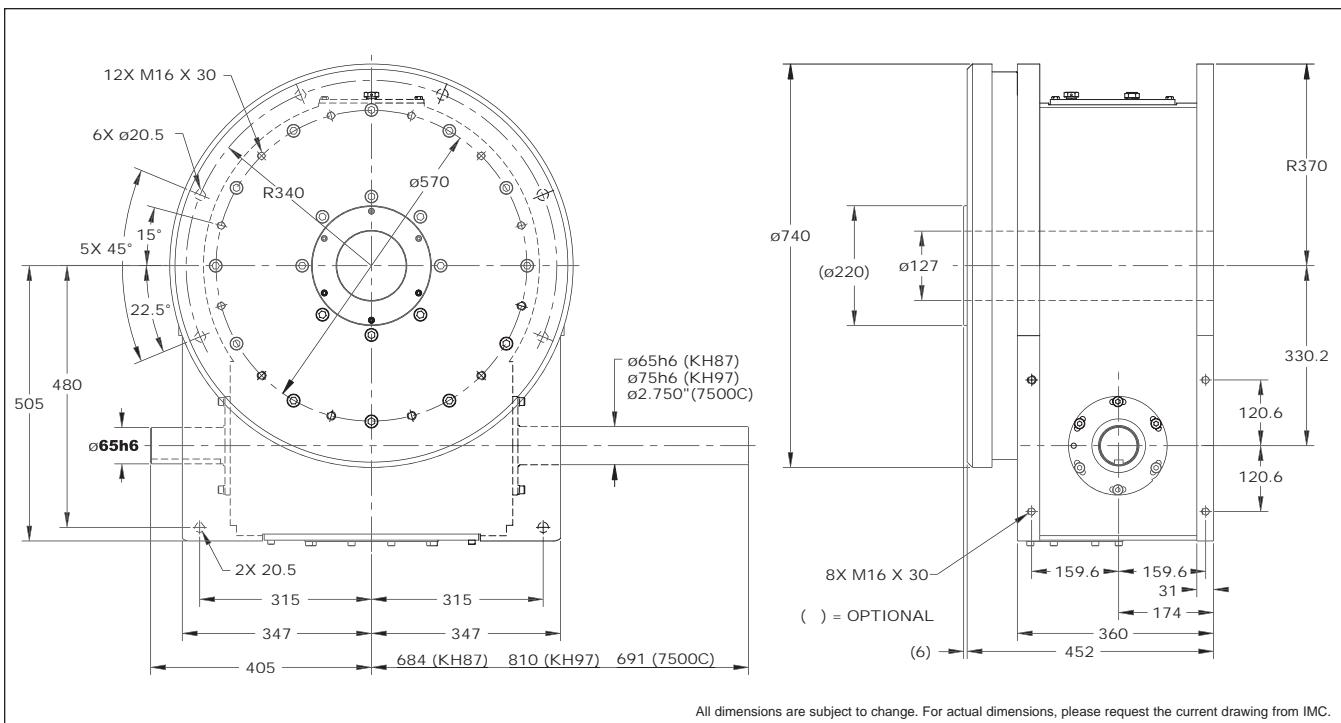

Features

The E-Series Index Drive is ideal for heavy-duty rotary dial applications with features including:

- ◆ Large output mounting surface supported by a 4-point contact bearing superior thrust and moment capacity
- ◆ Large center thru hole to accommodate stationary center post, electrical wiring and air or hydraulic lines
- ◆ Complete motorized drive package with reducer and brake-motor combinations to suit most applications
- ◆ Precision cam with preloaded cam followers for maximum accuracy
- ◆ Durable welded steel housing
- ◆ Preloaded "center rib" design for smooth acceleration and deceleration with precision positioning

Output and Input Overload Clutches

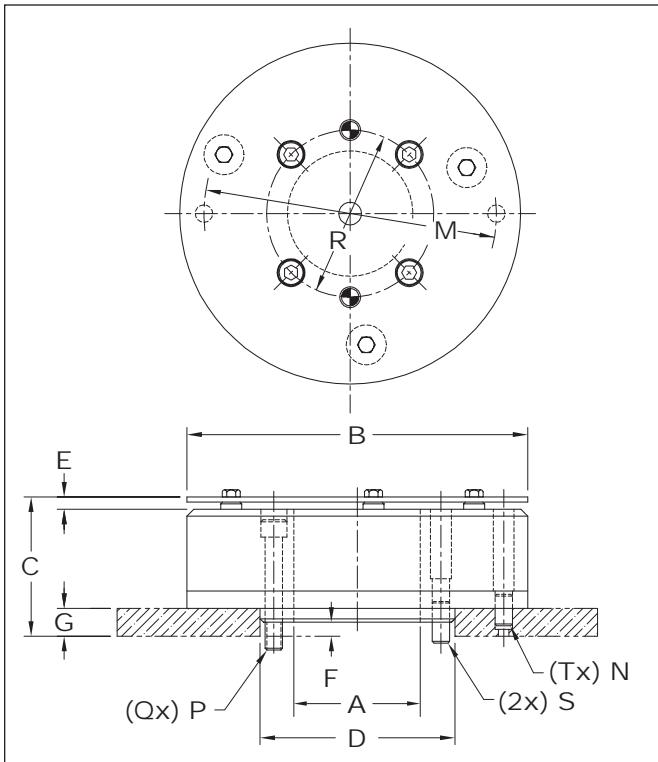

Features

IMC Output Overload and Rite-Torq® Clutches are designed to protect your indexing equipment from costly downtime due to overload or jam conditions by quickly disengaging the drive system.

- ◆ Easily Mounted to IMC index drives
- ◆ Single Position reset to maintain accuracy and machine timing
- ◆ Precision hardened and ground plungers and drive plate
- ◆ Overload Detector plate provides actuation for overload detector switch
- ◆ Variety of Models for all applications
- ◆ Standard & custom torque settings
 - Rite-Torq clutches are fully adjustable within a range
- ◆ Rigid, Backlash-Free design

IMC Input Overload Clutches (IOC) are used when an Output Overload Clutch cannot be used such as when the indexer is lifting a weight. IOC's have an adjustable torque setting and reset when the overload condition is removed.

“D” Clutch: Flange-Mounted Body

“D” Type clutches are designed to mount on IMC Index Drives with large dial mounting surfaces. The dial plate rests directly on the index drive output flange, providing stability and accuracy.

“D-SA” Clutch: Super-Accurate Flange-Mounted Body

IMC's Super Accurate "D-SA" clutches are designed to mount on IMC Index Drives which feature large dial mounting surfaces. Using externally mounted torque nuts, these clutches are easily adjustable throughout their entire torque range. "D-SA" clutches will re-engage to within ± 10 arc seconds of their original setting and may be used in wash down applications, making them ideal for use in the most demanding high-performance applications.

H

“S-SD” Clutch: Shaft to Flange, Shrink-Disk Mounting

IMC “S-SD” type clutches are designed to mount on IMC index drives without output flanges. The shrink disk design converts clamp loads from multiple high strength locking screws to radial gripping force through the use of circular wedges, providing the highest capacity mechanical interference connection available.

H

All dimensions are subject to change. For actual dimensions, please request the current drawing from IMC.

RITE-TORQ® “F/S” Clutch: Flange to Shaft Mounting

IMC “F/S” type clutches are designed to mount on IMC index drives. These clutches will flange mount to the output shaft, providing a rigid, compact and accurate connection.

All dimensions are subject to change. For actual dimensions, please request the current drawing from IMC.

Input Overload Clutches (IOC)

IMC's Input Overload Clutches (IOC) are used when an output overload clutch cannot be mounted to your index drive. The trip torque setting of the Input Overload Clutches is set under fully loaded, field conditions. When an overload condition is removed, the clutch automatically takes hold and carries peak load as usual. Resetting is required only when the load changes. Since the clutch mounts to the gear reducer used in the application. Your IMC sales representative will help determine the proper clutch and clutch bore size.

IOC Model	Reducer
180-IOC	R180
225-IOC	R225
260-IOC	R260
300-IOC	7300C
350-IOC	7350C

Parts Handlers

Features

IMC Parts Handlers are available in **Rotary**, **Linear** and **Walking Beam** configurations to meet your parts handling needs. They can be combined with IMC Index Drives and Precision Link Conveyors for a complete automated system.

- ◆ **RPP Cambot® Rotary Parts Handlers** (Page I-2) are designed for high precision and high capacity.
- ◆ **HD-LPP Heavy Duty Linear Parts Handlers** (Page I-15) offer smooth, controlled motions and high load capacities.
- ◆ **MR-LPP Mid-Range Linear Parts Handlers** (Page I-27) have side input shafts ideal for line shaft driven applications.
- ◆ **WBD Walking Beam Drives** (Page I-39) are an economic alternative to a short precision link conveyor.

Cambot® RPP Rotary Parts Handlers

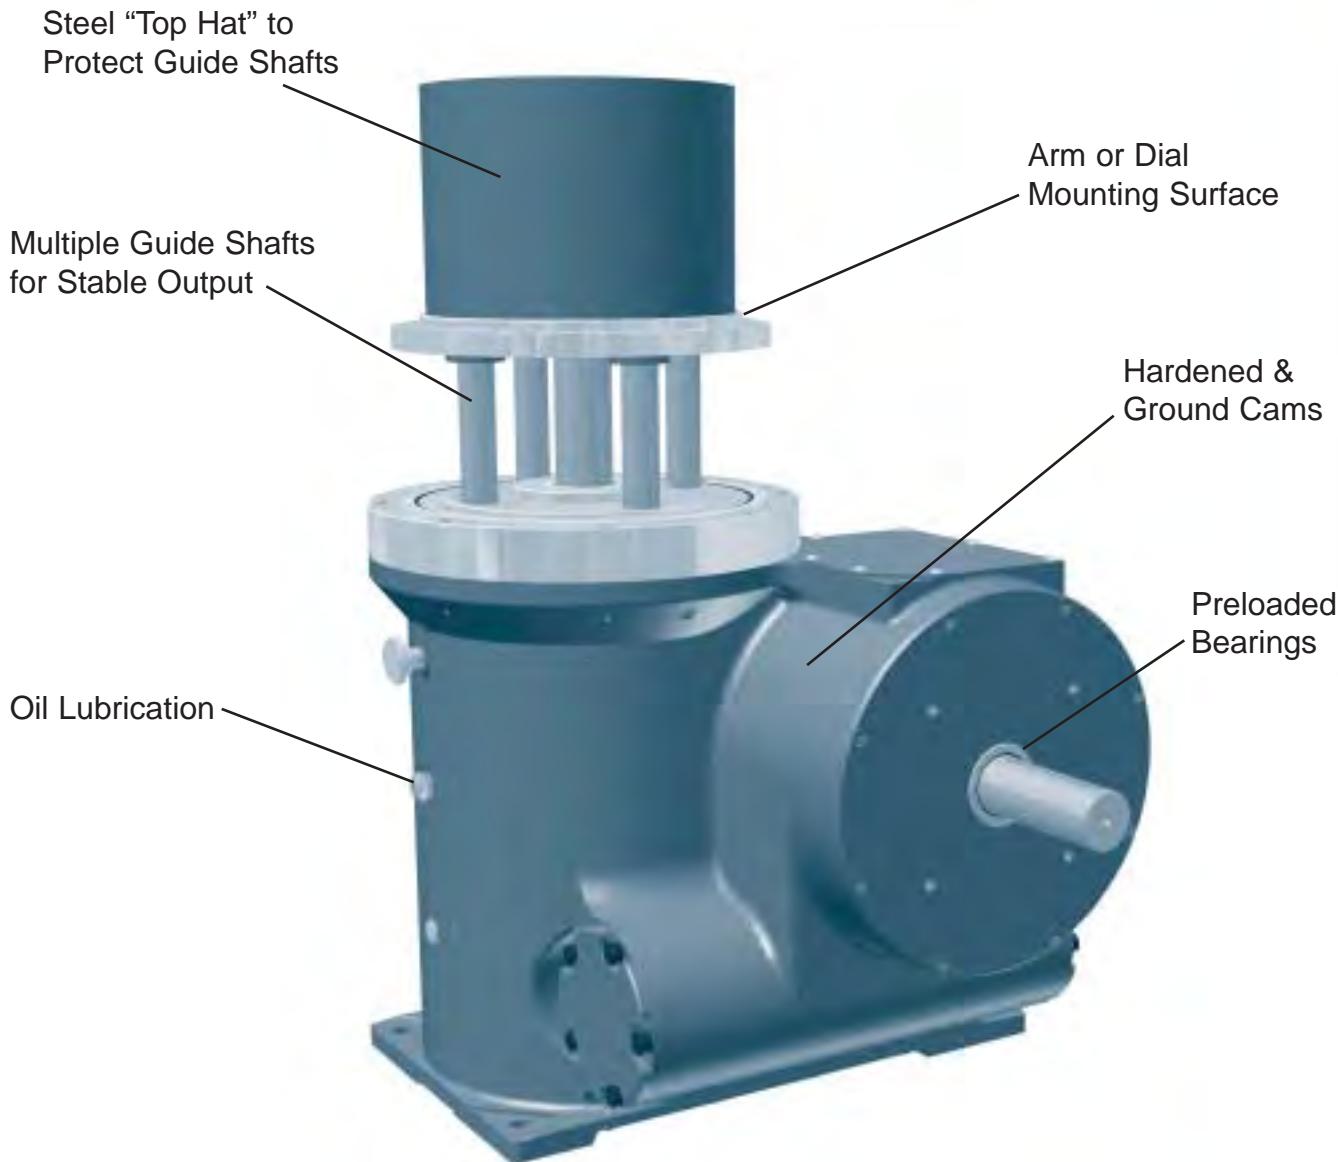

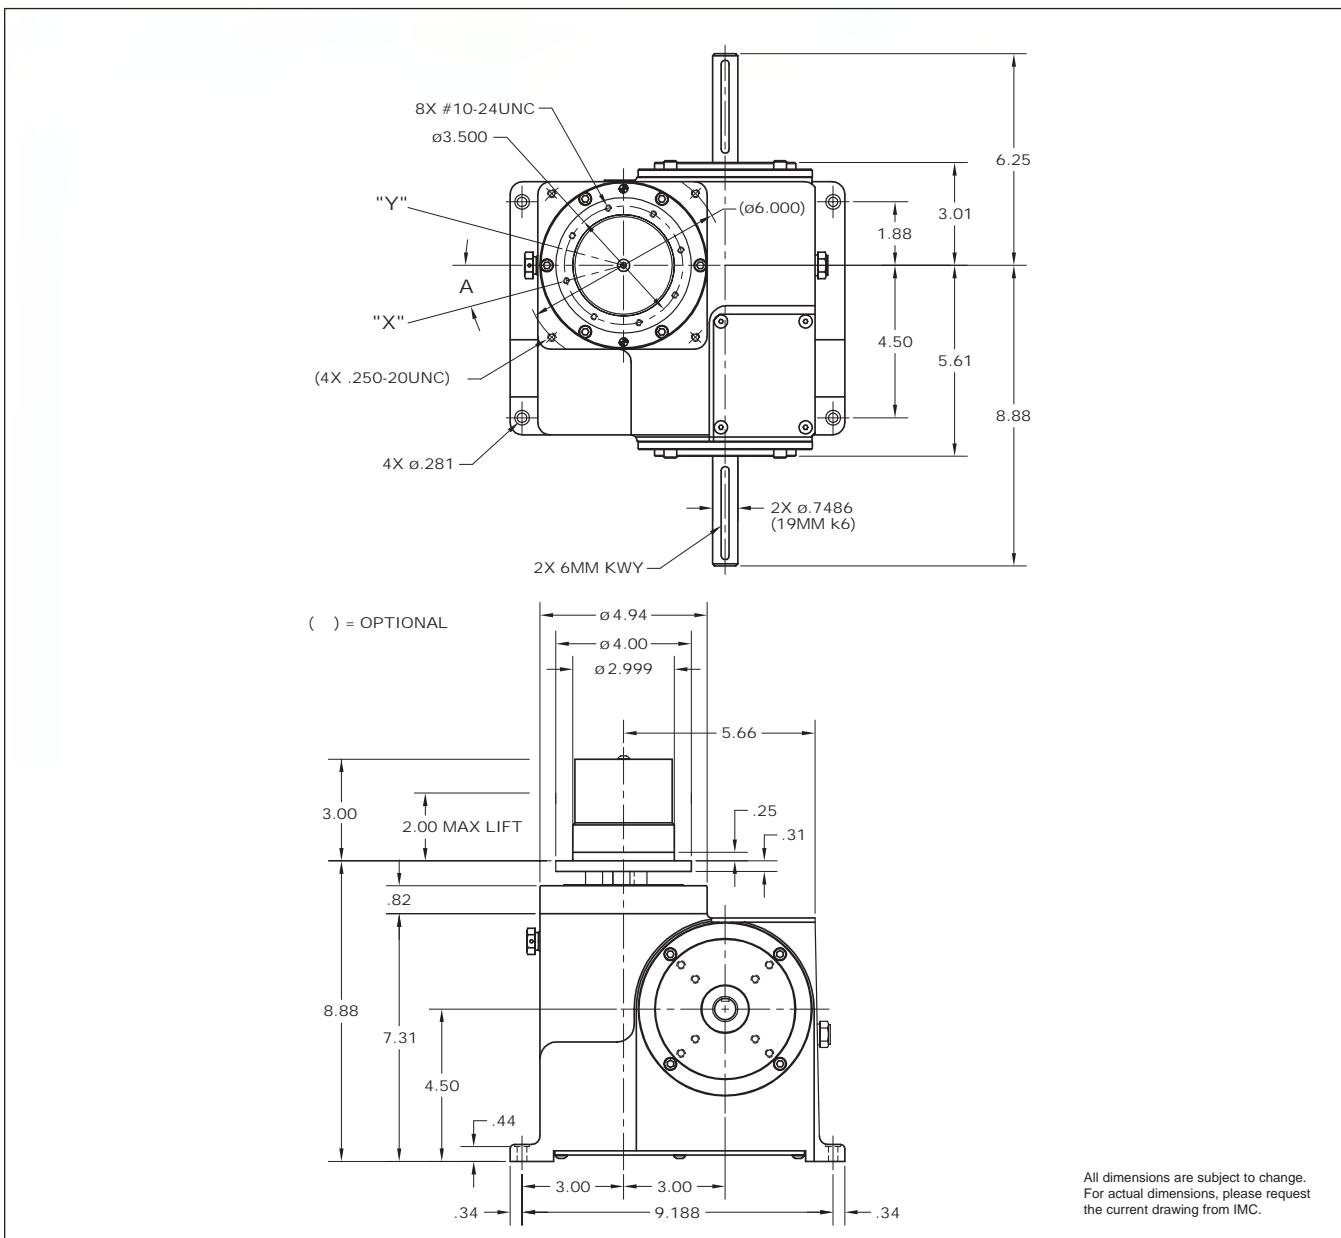

The IMC RPP Cambot® Rotary Parts Handler is designed for high precision and high capacity. This proven design can be used in a wide variety of industries including automotive, packaging and electronics among others. The RPP can be combined with other IMC products such as index drives and precision conveyors for a complete, automated system. The RPP is ideal for pick and place applications with features including:

- ◆ Rugged and precise cam operated mechanisms engineered for a minimum of 8000 hours of maintenance-free life.
- ◆ Hardened and ground cams drive both the lift and rotary axes.
- ◆ Preloaded precision cam followers eliminate backlash and ensure smooth movement.
- ◆ Preloaded taper roller bearings on the camshaft (Input Shaft).

- ◆ Four-point contact preloaded roller bearing on the rotary axis.
- ◆ All bearings are lubricated by an oil bath.
- ◆ One-piece lift arm.
- ◆ Ball bushings (recirculating-ball type) support the main lift shaft and turn the large output surface and ride on hardened shafts for stability and stiffness.
- ◆ Manufactured in a fully integrated application, design, manufacturing and inspection environment.

The RPP Cambot® can be made with custom motion sequences to synchronize with specific application requirements. An IMC Engineer can quickly evaluate possible sequences using IMC's sizing software.

Standard Package

150RPP with

- ◆ Standard Indexing or Oscillating Motion
- ◆ R180 Reducer (Ratios from 5:1 to 60:1)
 - Double Extended Worm Shaft (Input)
 - Worm Shaft Handwheel
- ◆ 1/3 hp DC Motor
- ◆ Varipak DC Motor Control (up to 30 cpm)

Optional Accessories

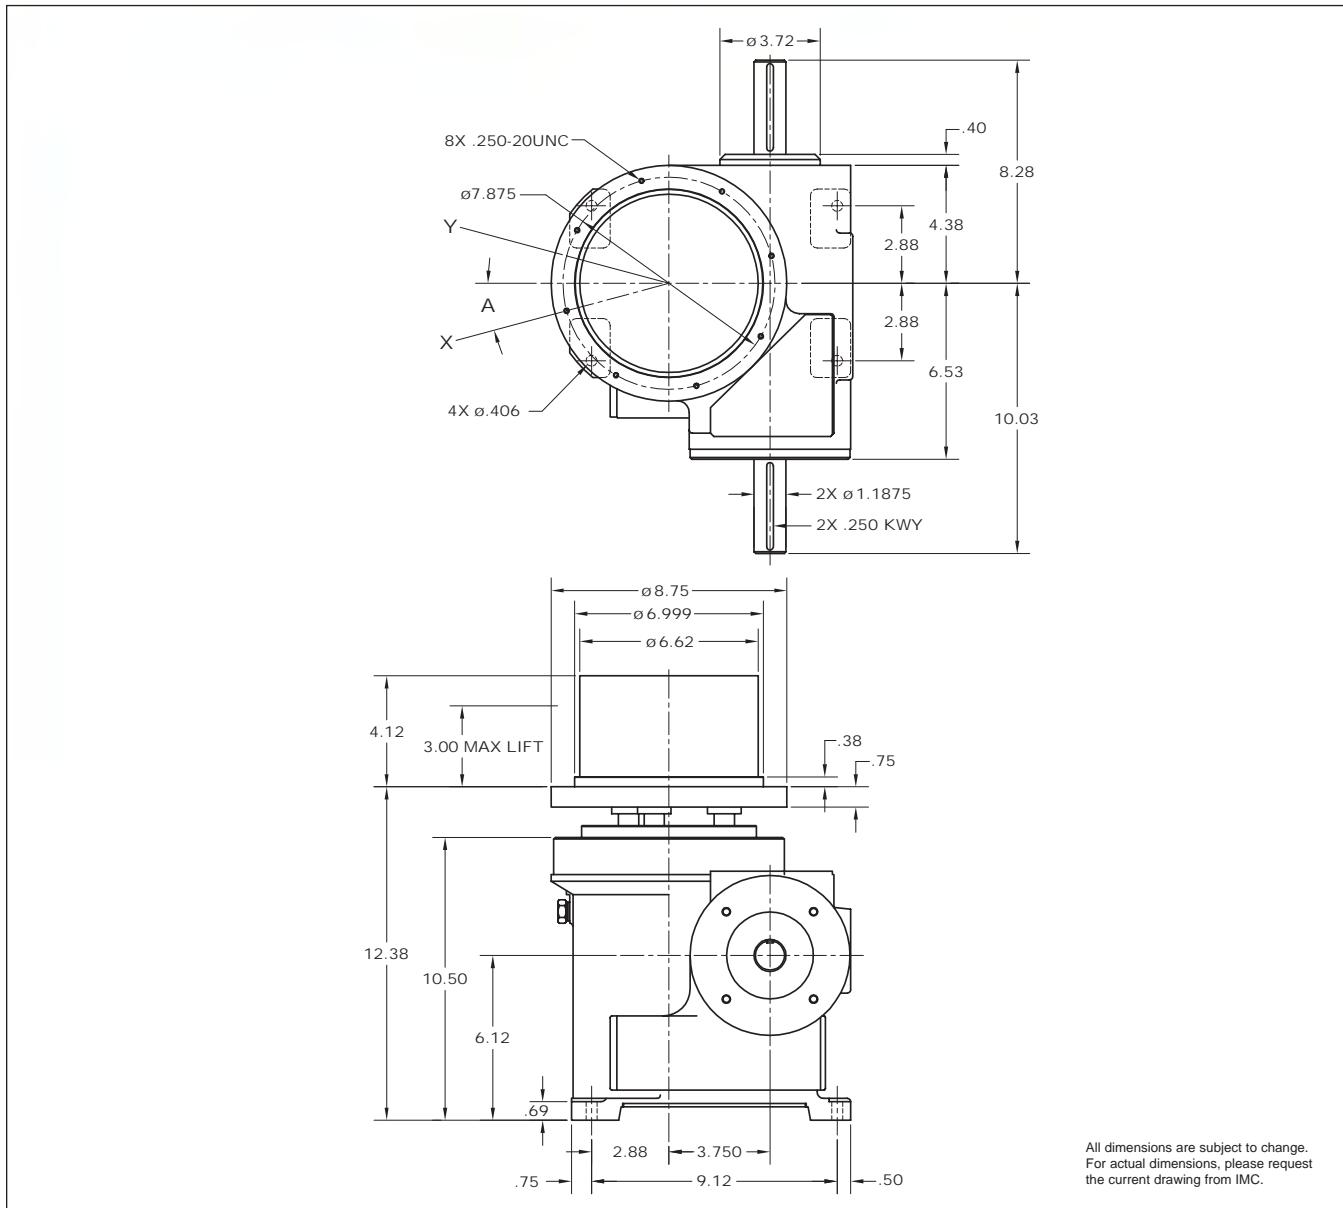

- ◆ 1/3 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ Electric Clutch-Brake
- ◆ 180-IOC Input Overload Clutch
- ◆ Digi-Dog Digital Programmable Limit Switch
- ◆ Camtronics Rotary Limit Switch

Capacity*

Maximum Mass: 50 lbs.

Maximum Inertia: 340 lb-in²

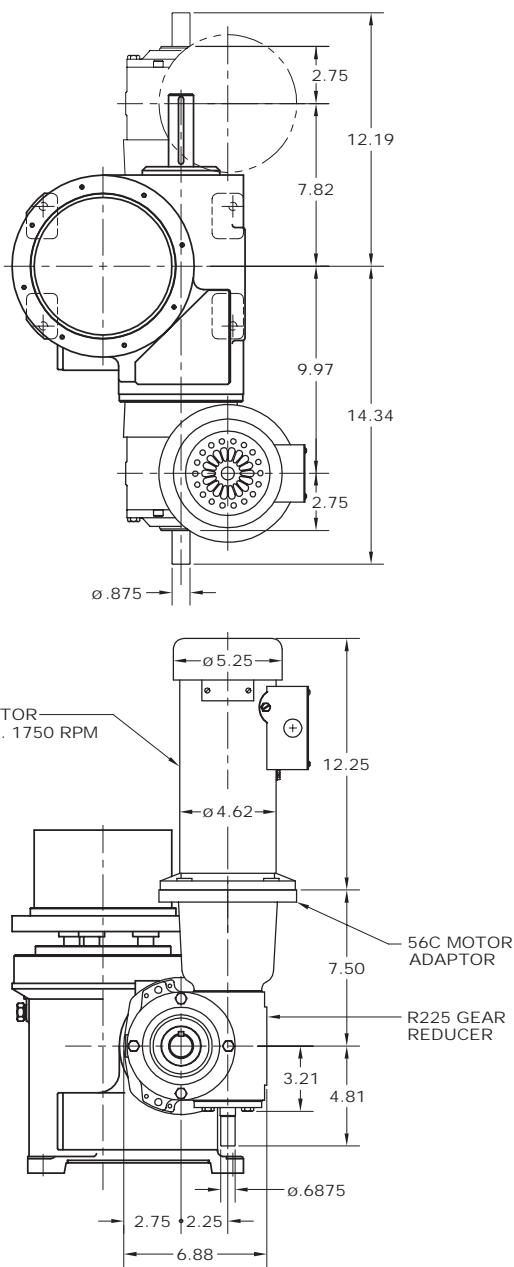

* **Note:** These values are for speeds of less than 30 rpm, the minimum cam time for rise and rotation, and are for reference only. Each application must be reviewed and approved by IMC Engineering.

* Note: These values are for speeds of less than 30 rpm, the minimum cam time for rise and rotation, and are for reference only. Each application must be reviewed and approved by IMC Engineering.

Timing Diagram – Oscillator

Motion Options

- ◆ Standard starting position (home) at time 0 is at maximum rise (up) and at the X rotary position.
- ◆ The standard sequence can be mirrored in either the lift, rotary or both:
 - The mirrored lift starts in the zero elevation or down position
 - The mirrored rotary motion starts at Y.
- ◆ Custom motion times are also available – consult your Sales Agent for more information.

Timing Diagram – Indexer

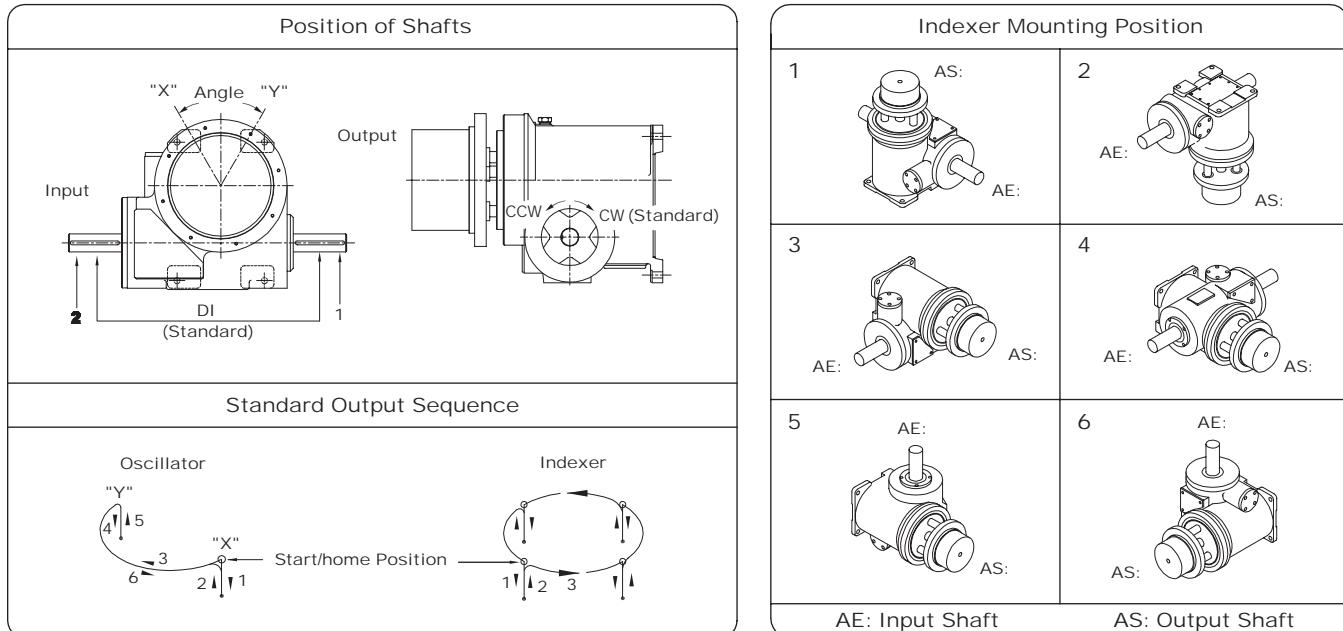

Motion Options

- ◆ Standard starting position (home) at time 0 is at maximum rise (up) and at the start of a counter-clockwise index (right-hand cam helix).
- ◆ The standard sequence can be mirrored in either the lift, rotary or both:
 - The mirrored lift starts in the zero elevation or down position
 - The mirrored rotary motion is a clockwise index (left-hand helix)
- ◆ Custom motion times are also available – consult your Sales Agent for more information.

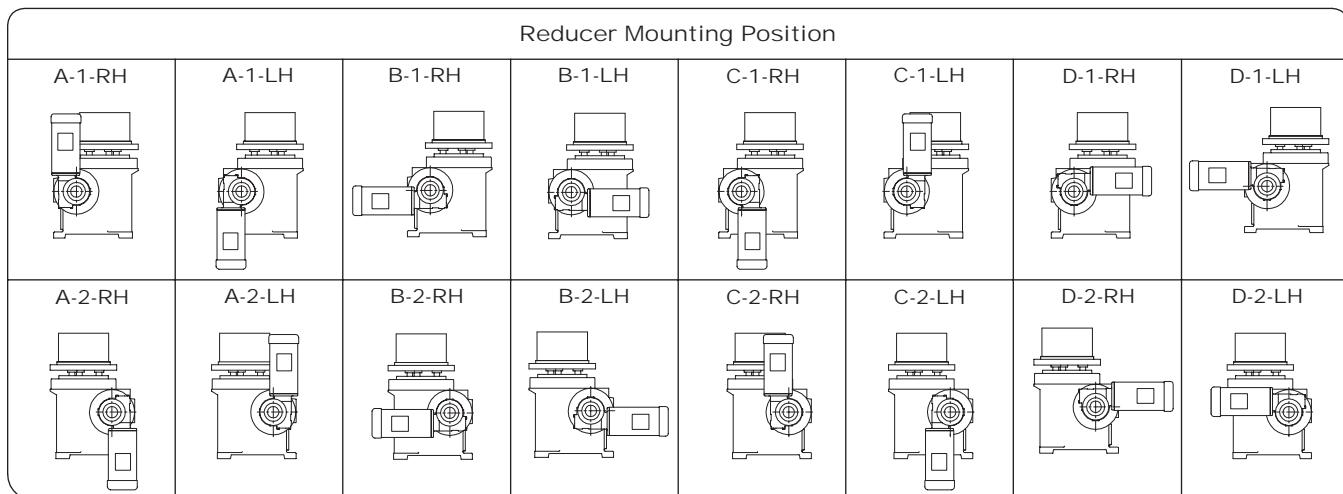

RPP Ordering Procedure

1. Model
2. Rotary Motion (degrees)
 - ◆ Oscillator or indexer
 - ◆ Oscillator: Home at X or Y
 - ◆ Indexer: CW or CCW index
3. Lift (inches)
4. Input Shaft: Side 1, Side 2 or Double Input (DI)
5. Mounting Position: 1-6

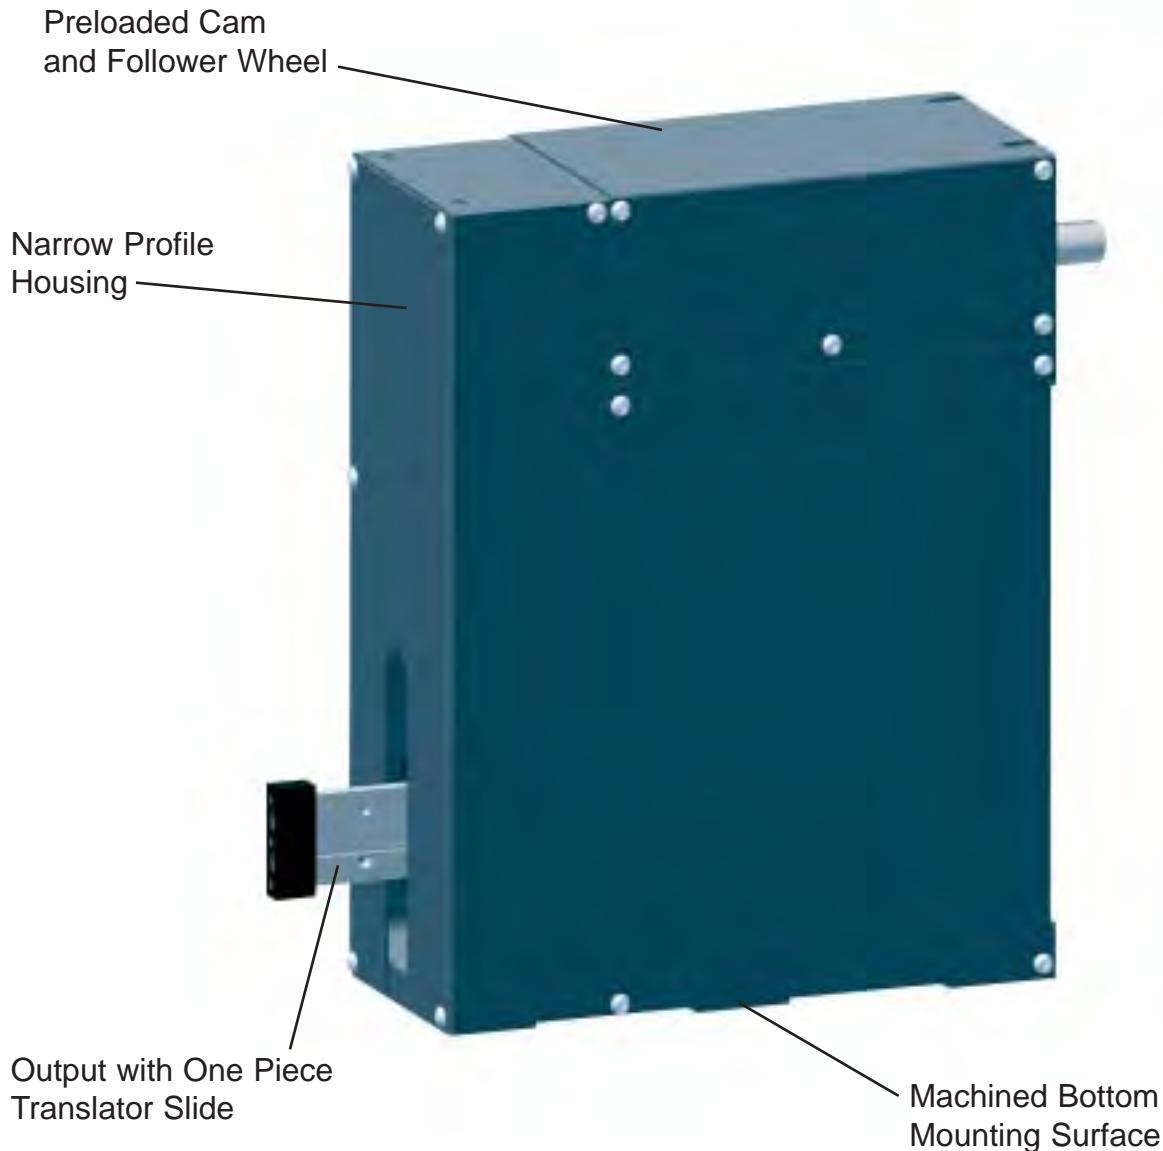

Reducer Ordering Procedure

1. Reducer Model, Ratio and Mounting Position
2. Motor Adaptor Model
3. Motor size

HD-LPP Heavy-Duty Linear Parts Handlers

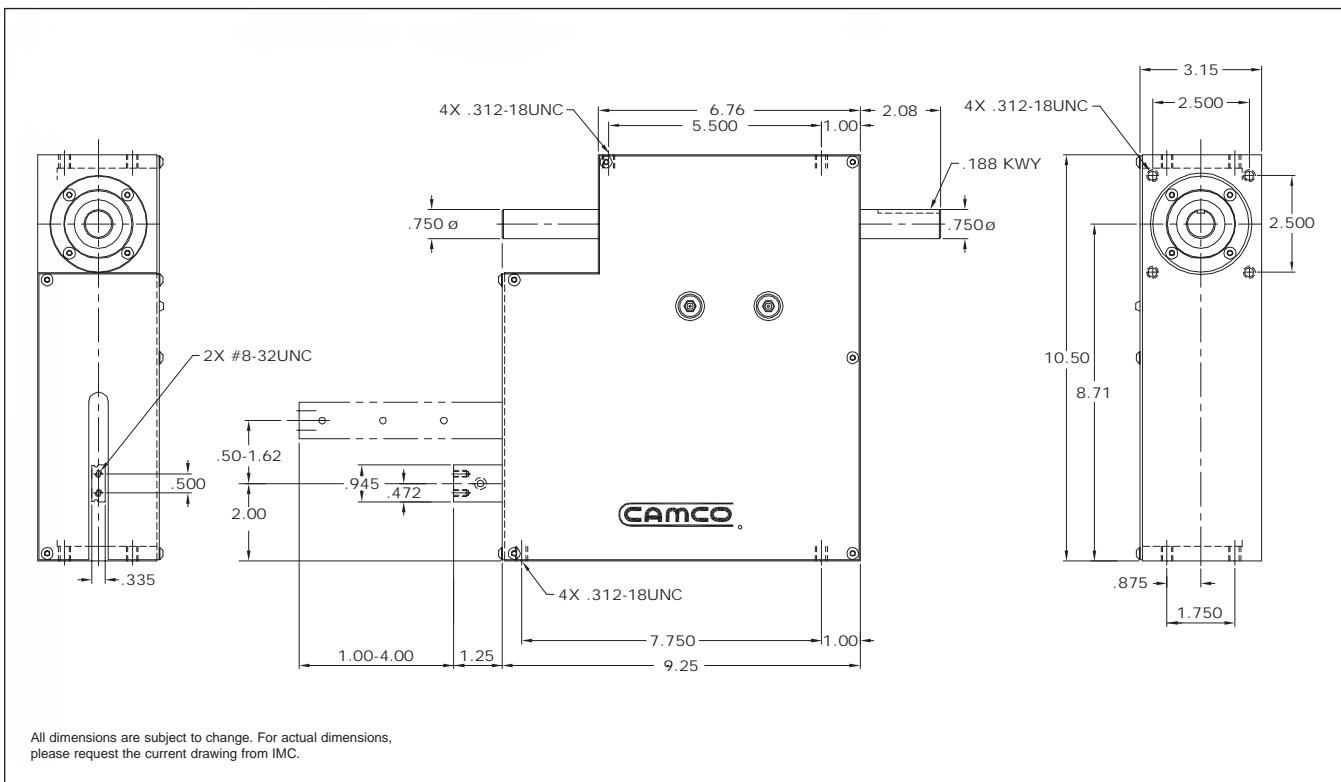

I

IMC HD-LPP Heavy-Duty Linear Parts Handlers offer smooth, controlled motions and high load capacities. The LPP can be combined with other IMC products such as index drives and precision conveyors for a complete automated system. The HD-LPP is ideal for linear pick and place applications with features including:

- ◆ High-speed capabilities – up to 60 cycles per minute
- ◆ Hardened and ground roller gear cams driving both axes.

- ◆ Fully preloaded roller gear cam and follower wheel design eliminates backlash and ensures smooth movement.
- ◆ Camshaft bearings are preloaded taper roller bearings.
- ◆ Compact design – small footprint
- ◆ Long-life grease lubrication

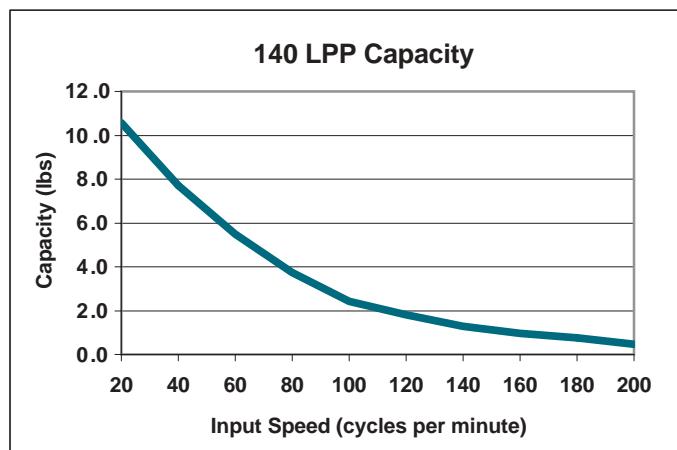

The roller gear cam and follower wheel provide for the greatest variety of motion sequences making the HD-LPP ideal for custom motion applications.

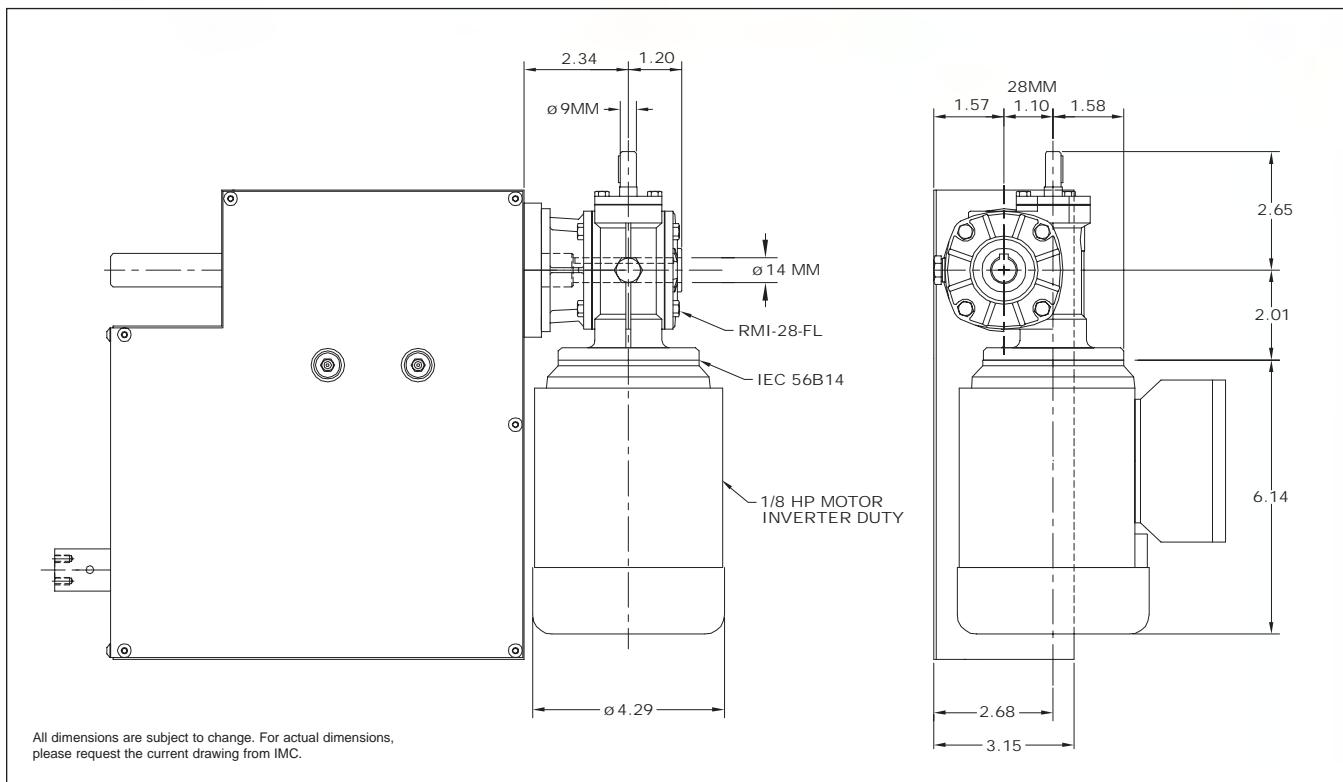

140LPP**Standard Motions**

- ◆ .50" Lift x 1.00" Transfer
- ◆ 1.00" Lift x 2.00" Transfer
- ◆ 1.50" Lift x 3.00" Transfer
- ◆ 1.62" Lift x 4.00" Transfer

Technical Specifications

Lift Accuracy	±.010"
Lift Repeatability	±.002"
Transfer Accuracy	±.005"
Transfer Repeatability	±.002"

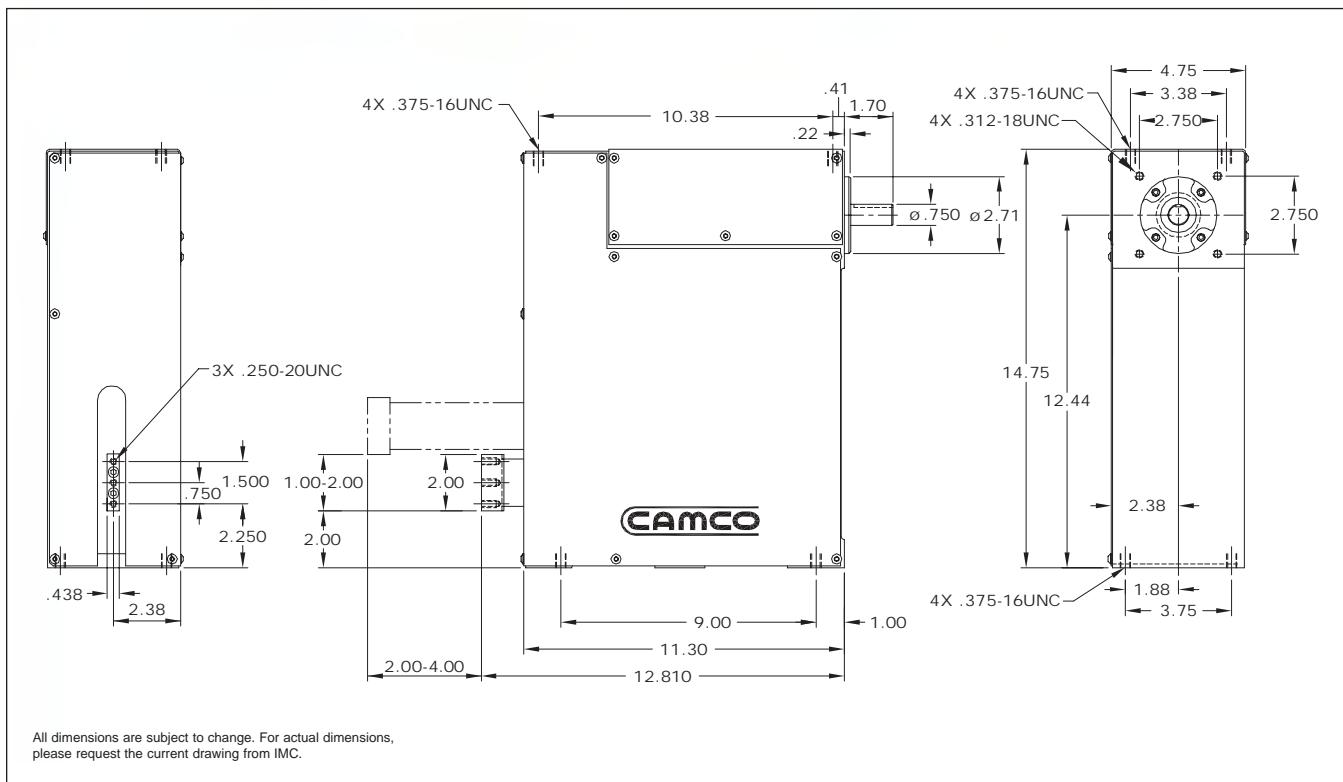

Standard Package

- ◆ RMI-28-FL reducer (Ratios from 1/7 to 1/100)
 - IEC 56B14 adapter
- ◆ 1/8 hp Inverter Duty Motor

Optional Accessories

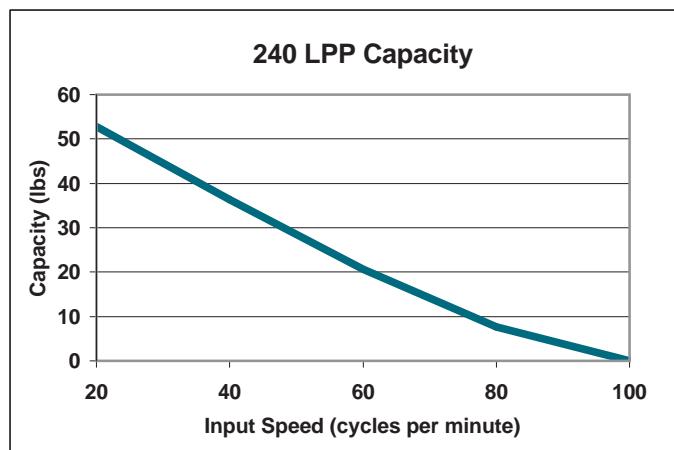

- ◆ Reducer with double extended input
- ◆ AC Inverter Duty Motor with AC Control
- ◆ Belt-Driven DC Gearmotor

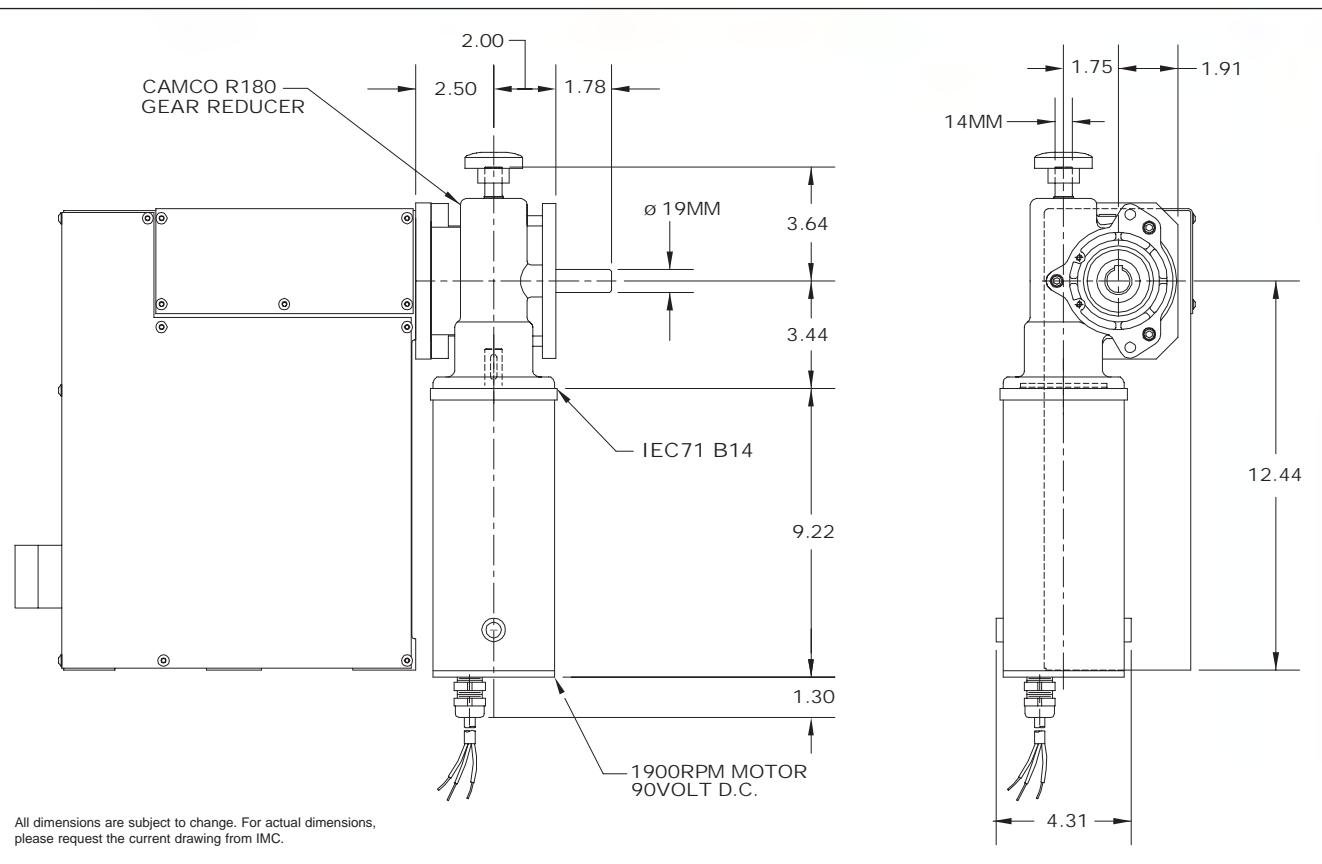

240LPP**Standard Motions**

Any combination of Lift and Transfer distances	
Lift Distance (in.)	1.00, 1.50 or 2.00
Transfer Distance (in.)	2.00, 3.00 or 4.00

Standard Package

4120LPP with

- ◆ Standard Motion Sequence
- ◆ R225 Reducer (Ratios from 5:1 to 60:1)
 - 56C Motor Adapter and Coupling
- ◆ 1 hp DC Motor
- ◆ Varipak DC Motor Control (up to 30 cpm)

Optional Accessories

- ◆ LF-RMI-70-F3 Reducer (1/7 to 1/100)
 - Optional Internal Overload Clutch
 - 1 hp Inverter Duty AC Brake Motor
- ◆ 1 hp AC Drive Package with Inverter Duty Motor and Inverter Drive (up to 60 cpm)
- ◆ 225-IOC Input Overload Clutch
- ◆ Digi-Dog Digital Programmable Limit Switch
- ◆ Camtronics Rotary Limit Switch

Standard Motion Sequence

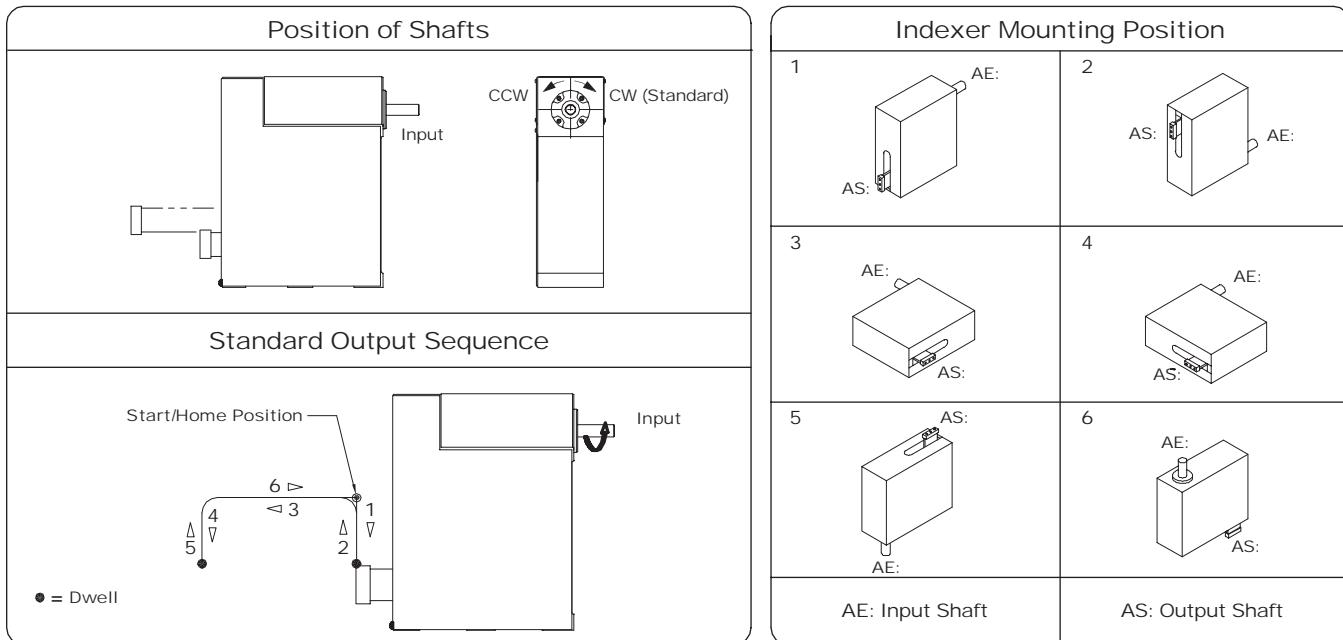

Motion Options

Standard starting position (home) at time 0 is at maximum lift (up) and fully retracted.

- ◆ The motion sequence can be mirrored in either the lift or transfer axes or in both axes.
 - The mirrored lift starts in the down position.
 - The mirrored transfer starts extended.
- ◆ Custom motion times are also available – consult your Sales Agent for more information.

Mid-Range Linear Parts Handlers

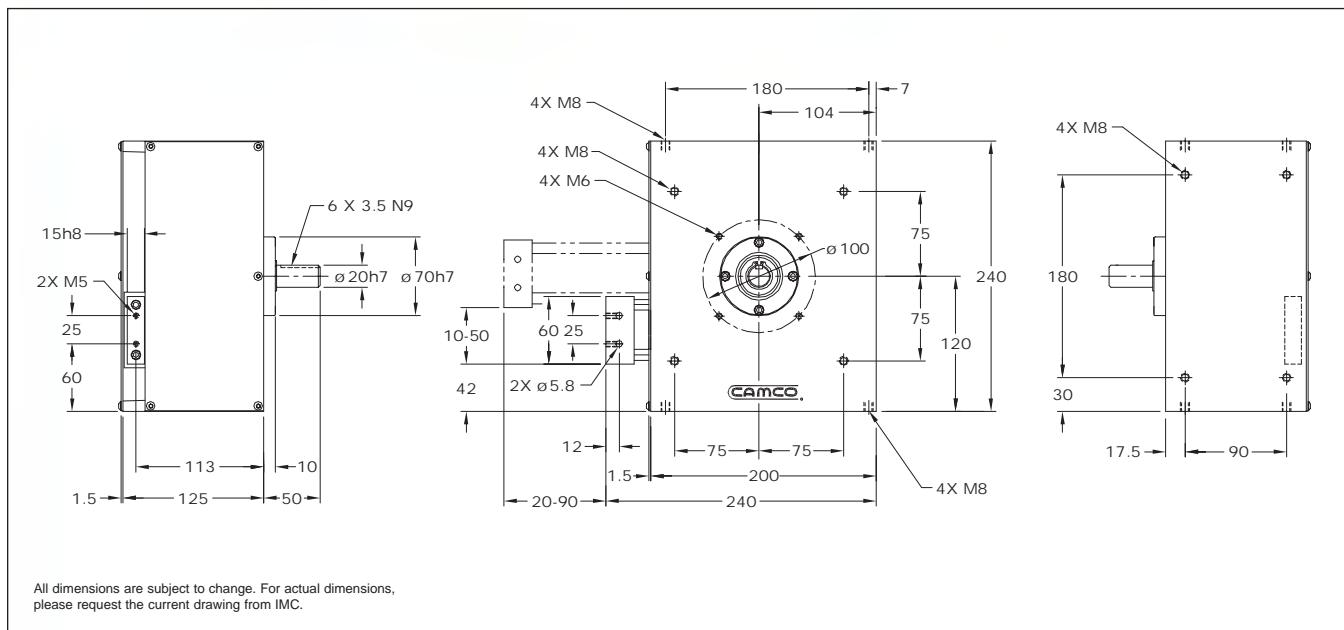

I

IMC Mid-Range Linear Parts Handlers (MR-LPP) are ideal for linear pick and place motions. With the input shaft extending from the side of the unit, multiple units can be placed side-by-side and line shaft driven with timing belts and pulleys.

- ◆ Lift and Transfer strokes can be adjusted in the field in 10 mm increments.
- ◆ Hardened and ground cams drive both axes.
- ◆ Preloaded, precision cam followers eliminate backlash and ensure smooth movement.

- ◆ Preloaded bushings (re-circulating ball type) support the internal carriage that drives the customer mounting surface. The ball bushings ride on hardened shafts providing stability and stiffness.
- ◆ Camshaft bearings are preloaded taper roller bearings.
- ◆ Compact Design
- ◆ Long-Life Grease Lubrication

WBD Walking Beam Drives

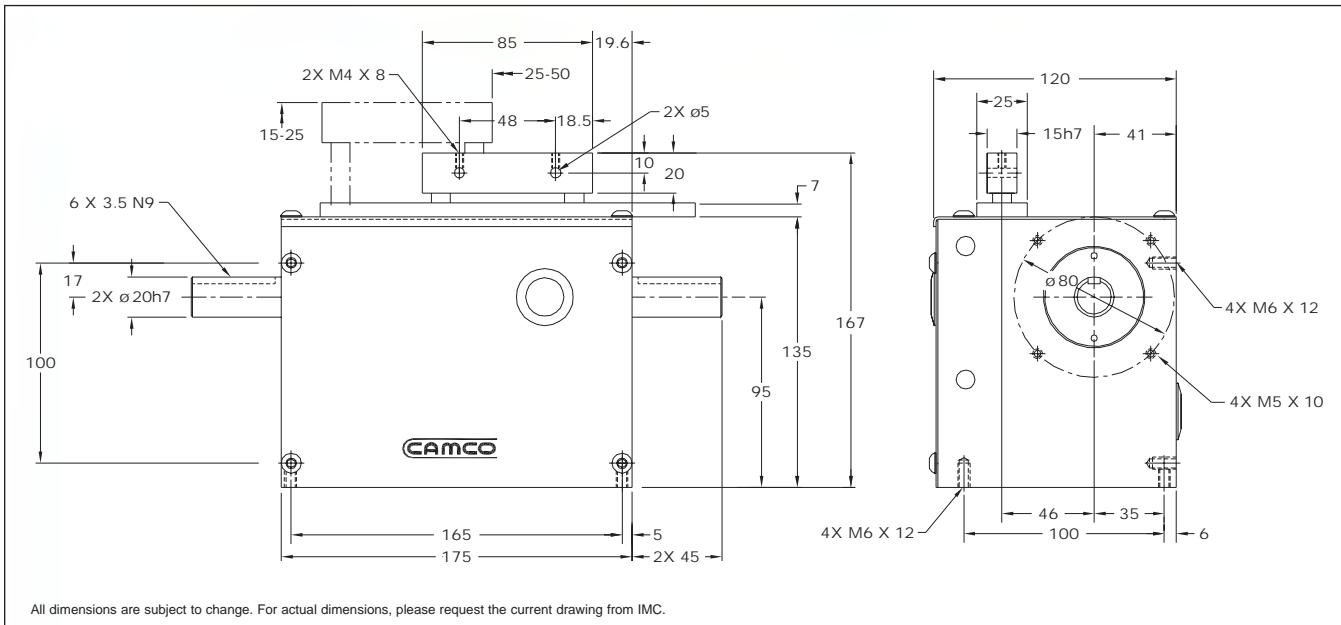

I

The IMC Walking Beam Drive (WBD) part handlers are rugged and precise cam operated mechanisms engineered for a minimum of 8000 hours of maintenance free life. A proven global design, there are several thousand drives used in automotive, packaging, electronics and many other industries.

IMC Walking Beam Drives provide the basis for highly accurate linear motion. The WBD is an economical alternative to a short precision link conveyor. It can also be used as a linear parts handler or a single axis actuator. Other features include:

- ◆ Hardened and ground cams drive both axes.
- ◆ Preloaded, precision cam followers eliminate backlash and ensure smooth movement.

- ◆ Preloaded bushings (re-circulating ball type) support the internal carriage that drives the customer mounting surface. The ball bushings ride on hardened shafts providing stability and stiffness.
- ◆ Preloaded taper roller bearings on Camshaft.
- ◆ Compact Design
- ◆ Long-Life Grease Lubrication
- ◆ Preloaded dust cover and shaft seals keep the internal mechanism clean.

Precision Link Conveyors

Features

IMC Precision Link Conveyors are ideal for linear transfer applications with features including:

- ◆ Table Top or Heavy Duty versions
- ◆ Precision positioning of parts for assembly or manufacturing processes
- ◆ High Speed station to station parts transfer
- ◆ Precision Links with roller bearings and precision ground cam followers for smooth transfer and long life
- ◆ Link size range to meet most application requirements
- ◆ Optional Bases, Line Shafts and Tooling Mounting Plates
- ◆ Complete with Motorized Index Drive system including transfer overload protection.

J

Precision Link Conveyors

IMC Precision Link Conveyors combine excellent accuracy and high load capability with versatility to meet any automation challenge. In combination with a IMC index drive package and IMC parts handlers, these conveyors can be relied on as the cornerstone of in-line automatic assembly applications.

High Speed and Accuracy

Precision-machined conveyor chain links are driven by a high-performance IMC Index Drive. The Conveyors are equipped with a precision machined chordal compensation cam which maintains a precise tension level in the link assembly at all times for high accuracy and speed capability

Versatility

Many Precision Link Conveyors features can be customized including conveyor length, index distance, index motion, link fixture mounting pattern, drive package component and drive package arrangement. In addition, custom options include tooling plates, line shafts, and custom bases.

Customization

To suit your needs, IMC will design and build your entry precision conveyor sub-assembly, ready for your tooling. IMC parts handlers and auxiliary index drives can be mounted to work synchronously with the conveyor. IMC quality in every component ensures the highest accuracy and durability for your automation application.

Precision Links

Each link of a precision conveyor is machined to IMC's exacting standards. Roller bearings are built into the link for smooth pivotal action between each link. Precise positioning is guaranteed by hardened ground cam followers pre-loaded against precision ground tracks in the conveyor body. All bearings are greased and sealed for ease of maintenance and extended life.

Easy to Tool

Optional tooling and parts handler mounting surfaces are available for easy, convenient machine building.

Compact Design

In-line design saves floor space and provides maximum accessibility for tooling. Both Over/Under and Carousel design are available in lengths to meet your needs.

Table Top Precision Link Conveyors

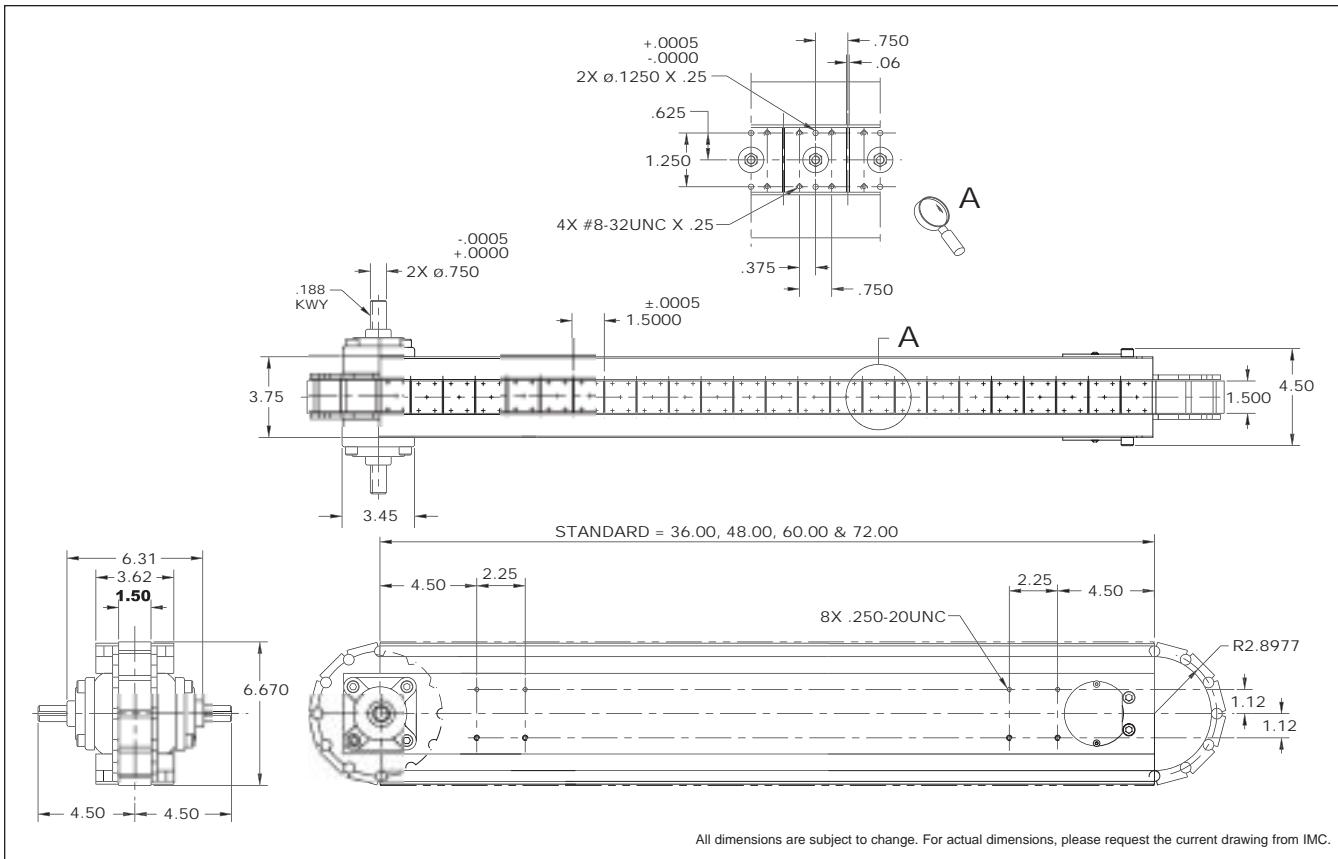

IMC Table Top Precision Link Conveyors are available in a variety of standard configurations. Standard link lengths include: 1.5", 2.0", 3.0", 4.5" and 6.0".

Table Top Conveyor Modules are available with and without a drive package. They can be oriented in any direction without affecting capacity, accuracy or ease of maintenance. Typically, they are mounted directly to the top surface or wall of your machined base.

Table Top Conveyor drive packages feature a shrink-disk mounted output overload clutch offering a zero-backlash connection between the indexer and the conveyor. It also provides phase adjustability and added protection for the indexer.

The Table Top Conveyor configurations shown here are intended as a general guideline in the design of your automation system. Your IMC Sales Agent will help you determine any options or customer modification you may require.

1.5 Basic Module

Heavy Duty Precision Link Conveyors

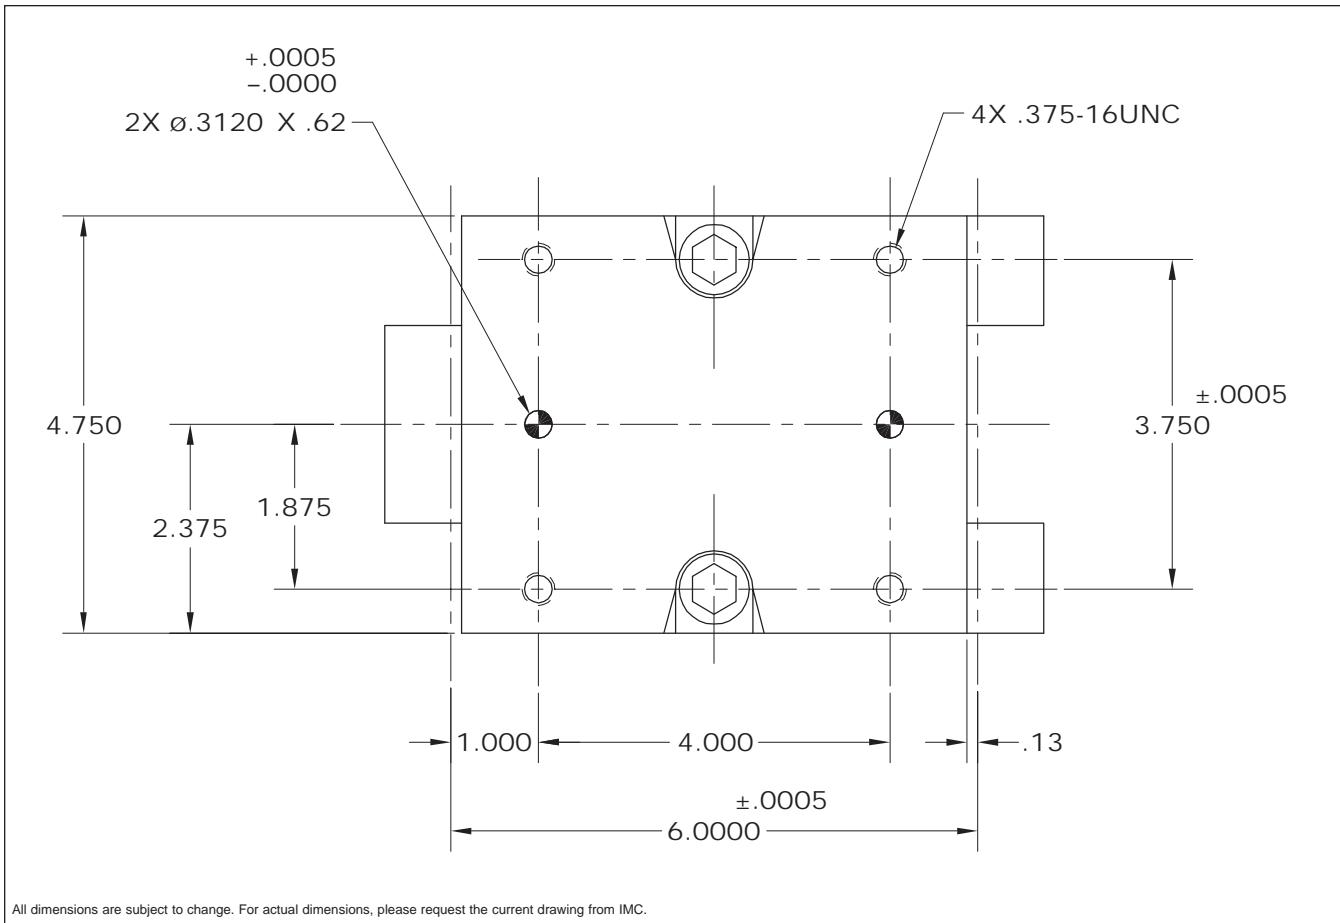

IMC Heavy Duty Precision Link Conveyors are available with standard link lengths of 6.0", 9.0" and 12". They are available in Over/Under and Carousel configurations. Both configurations include heavy-duty legs and a precision machined base designed to hold large loads and maintain system accuracy. Adjustable soft machine mounts are available on the base to accommodate inconsistent on-site flooring.

The conveyor is available with either an "open backbone" or "closed backbone" design. The open backbone allows for convenient passage of tooling, drive shafts, timing belts, and hydraulic, air or electrical lines through the center of the conveyor. The closed backbone design is ideally suited to mounted IMC parts handlers and tooling plates and offers increased rigidity.

Like the Table Top Series, Heavy Duty Conveyors can be mounted in any direction simply by modifying the supports with no change in accuracy, load capacity or maintenance requirements.

The Heavy Duty Conveyor configurations shown here are intended as a general guideline in the design of your automation system. Your IMC Sales Agent will help you determine any options or customer modification you may require.

Ordering Procedure

The following ordering procedure is intended as a general guideline for the minimum information required when ordering a Precision Link Conveyor.

Required Information

- ◆ **Link Size:** 1.5, 2.0, 3.0, 4.5, 6.0, 9.0 or 12.0
- ◆ **Type:** Table Top or Heavy Duty
- ◆ **Style:** Over/Under or Carousel
- ◆ **Length:** Standard per catalog or Custom, expressed as center distance, in inches
- ◆ **Height:** Standard per catalog or Custom, in inches

Technical Assistance

All Precision Link Conveyor applications are verified by a IMC sales agent using the IMC Sizing Program.

Your IMC agent is available to make all sizing calculations for you.

Your IMC Sales Agent will help you clearly specify any alterations you need to meet your design requirements.

Required Information when ordering Drive Package

- ◆ **Type:** Standard, Alternate, Heavy-Duty or Special
- ◆ **Drive Side:** 1 or 2 (for Over/Under)
- ◆ **Index Distance:** In inches
- ◆ **Indexer Model:** Specific model number or special

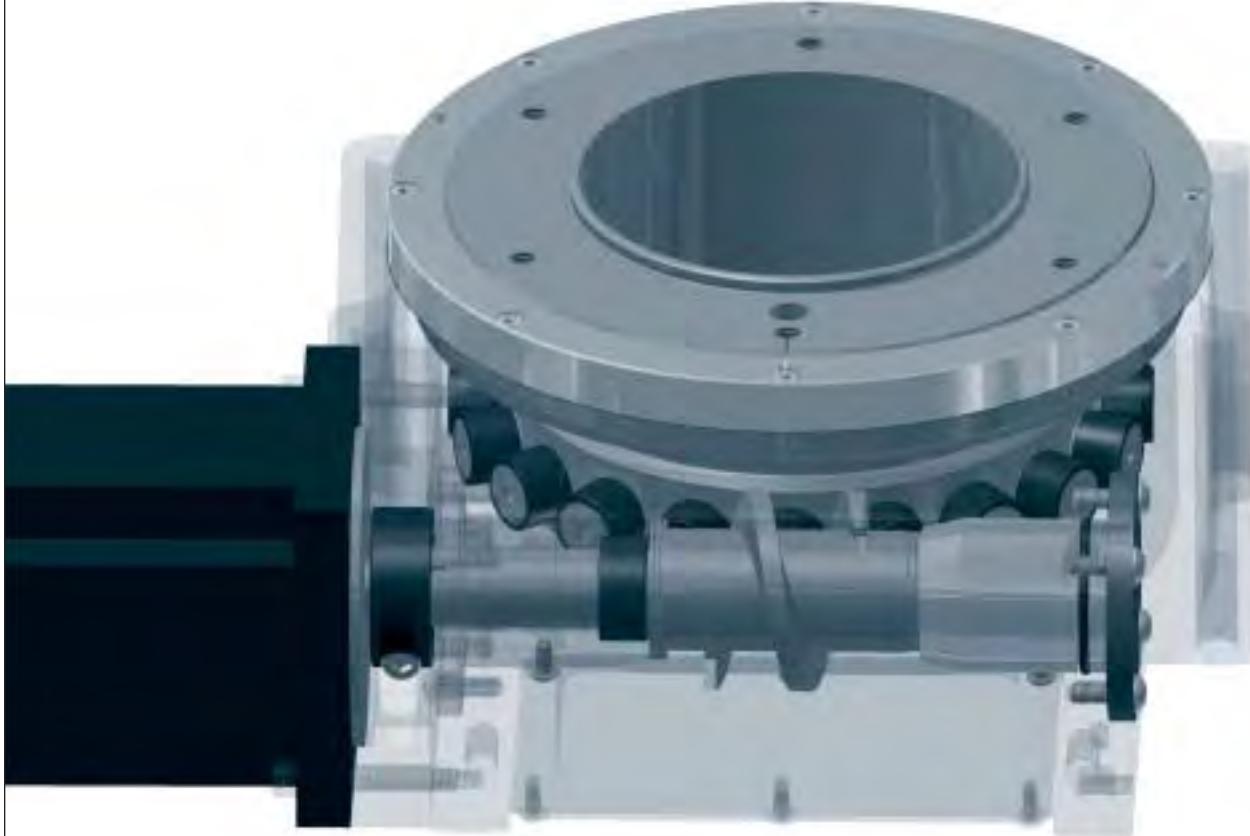

Servo-Mechanical Drives

Features

IMC Servo-Mechanical Drives combine the flexibility of a servomotor with the accuracy and reliability of a cam-driven index drive. They can be ideal for dial, conveyor, or linkage applications. The drives are offered in several configurations

- ◆ The **Flex-i-Dex** drive is a dedicated Servo-Mechanical package complete with servomotor and amplifier ideal for light duty applications or short, fast movements.
- ◆ **Constant Lead** cam drives are standard RDM or Heavy Duty E-Series drives with constant lead (constant ratio) cams. Supplied with or without a reducer and servomotor package, they offer a large mounting surface, bearing support and thru-hole. Supply your own servo package or use ours.

K

Servo-Mechanical Drives

The Servo-Mechanical Drive is a zero-backlash, high-efficiency, long-life, low-maintenance precision rotary actuator. The actuator consists of an IMC indexer with a constant ratio cam and a servomotor. A secondary reducer may be added for applications requiring a very slow movement, extra mechanical advantage or motor inertia matching. The Servo-Mechanical Drive features:

- ◆ **Large Output Flange and Bearing** with metric or imperial tapped holes for fastening the load.
- ◆ **Large Center Hole** for a stationary center post or to run air, hydraulic or electric lines.
- ◆ **Output shaft with precision cam followers** meshes with a hardened and ground cam. The cam is made with a fixed ratio from 2:1 to 24:1. Low ratios are recommended for large angular movements while high ratios are used for small, fast movements.

- ◆ **Zero Backlash** is produced by preloading the cam followers against the cam surface.
- ◆ **High Efficiency** due to cam followers rolling (not sliding) on the cam while submerged in oil.
- ◆ **Clamped or dowel-pinned joints** eliminate backlash caused by worn keys. Keys are used for timing and assembly purposes only.
- ◆ **Servomotor mounted directly to the camshaft.** The motor shaft is inserted into the hollow bore of the split camshaft. A locking clamp collar joins the motor shaft to the camshaft.
- ◆ **Secondary reducers** have minimum backlash and NEMA or IEC frames for mounting the servomotor.

The Servo-Mechanical Drive is the ideal unit for applications where flexibility, electronic synchronization, digital communication and high accuracy and repeatability are needed.

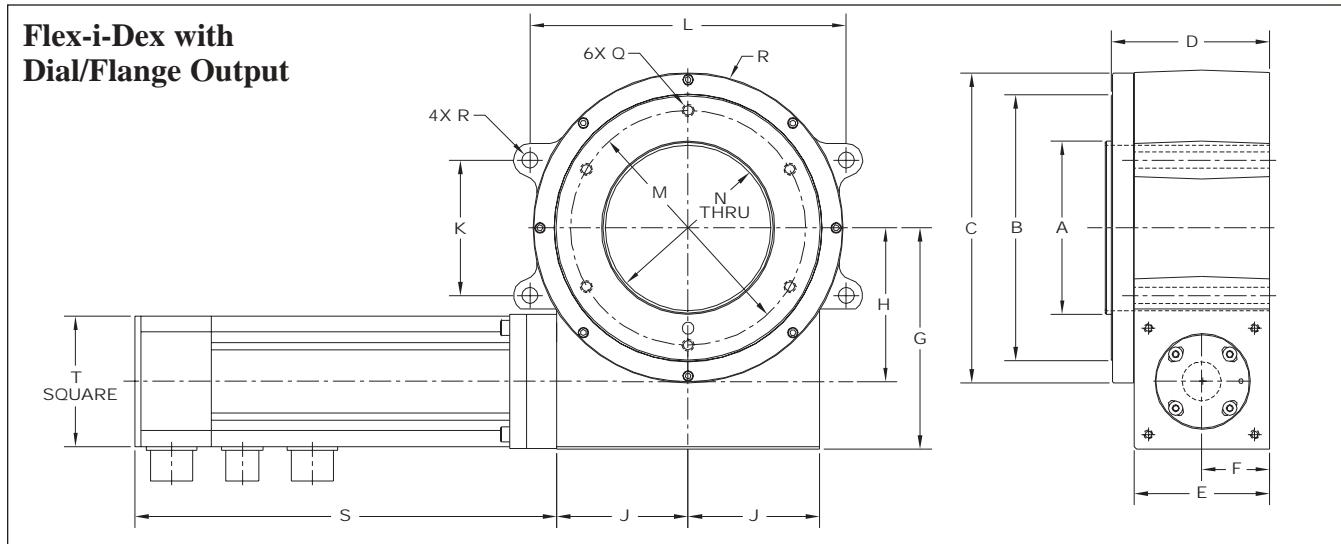

Flex-I-Dex

The Flex-i-Dex is ideal for light duty applications or short, fast movements. The complete Flex-i-Dex package includes:

- ◆ Flex-i-Dex constant-lead (constant ratio) drive with either a large flange output or a shaft output.

- ◆ Control Techniques Servo Motor, Uni-Drive SP controller, power and logic cables and Power Tools software.

All dimensions are subject to change. For actual dimensions, please request the current drawing from IMC.

For heavier applications IMC has complete package solutions using the RDM Series or E-Series Drives with constant lead (constant ratio) cams. These are available as a complete solution including the servo package or as the mechanical platform only.

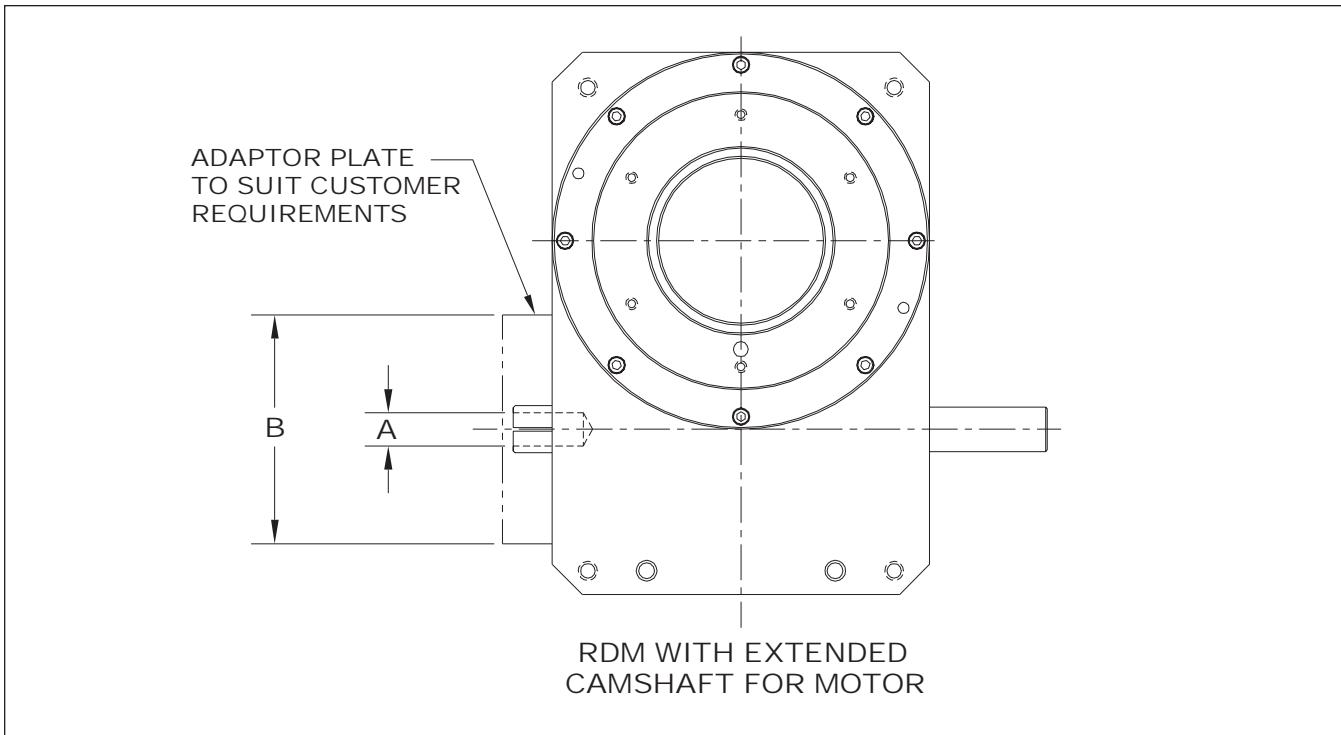

Complete Package

IMC can provide a complete servo-driven solution consisting of the mechanical assembly, servomotor and controller. All IMC complete packages are supplied with Control Techniques Servo Motors (up to 14.57 hp or 10.87 kW), Uni-Drive SP controller, power and logic cables and Power Tools software as standard.

Basic Mechanical Platform

The mechanical platform uses the RDM or E-Series cam-operated drive alone or with a reducer. You can use your preferred servomotor, amplifier and controller to drive the unit. An IMC sales or applications engineer can size and select the right cam drive for your application. As a preliminary guide for motor or reducer sizing please refer to the charts on pages K-4 and K-6 for the shaft and flange sizes as well as the minimum motor RMS torque or reducer rating (Assembly Torque on page K-8) required for each.

Servo-Driven RDM

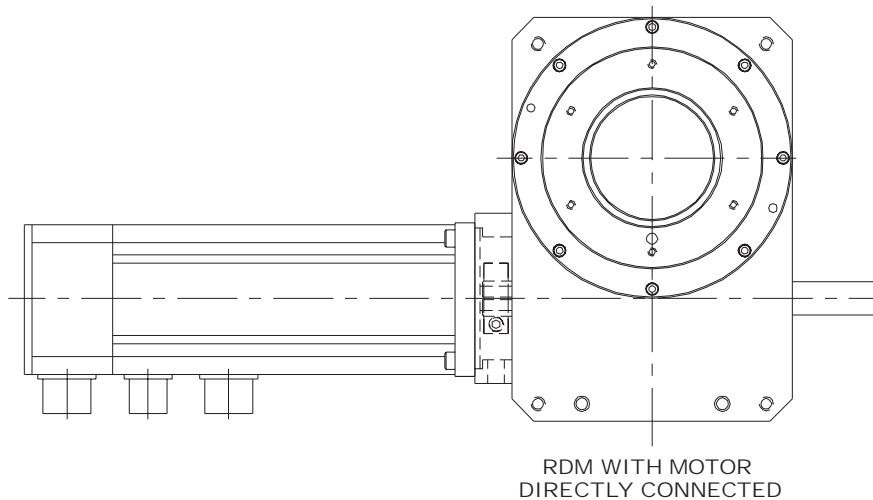

Dimensions – Servo-Driven RDM

All dimensions are subject to change. For actual dimensions, please request the current drawing from IMC.

For RDM drive dimensions see section B of this catalog.

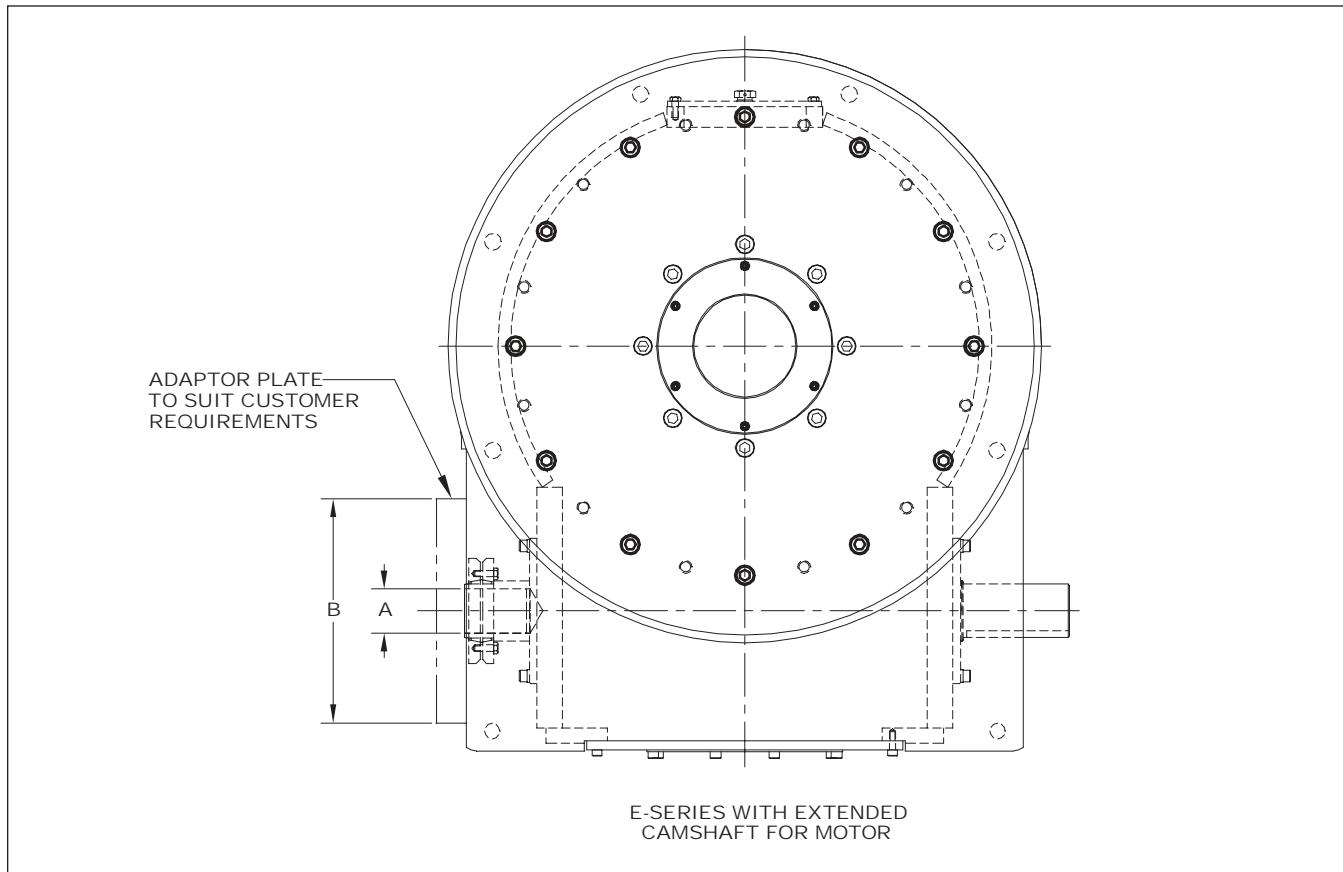

K

Servo-Driven Heavy-Duty E-Series

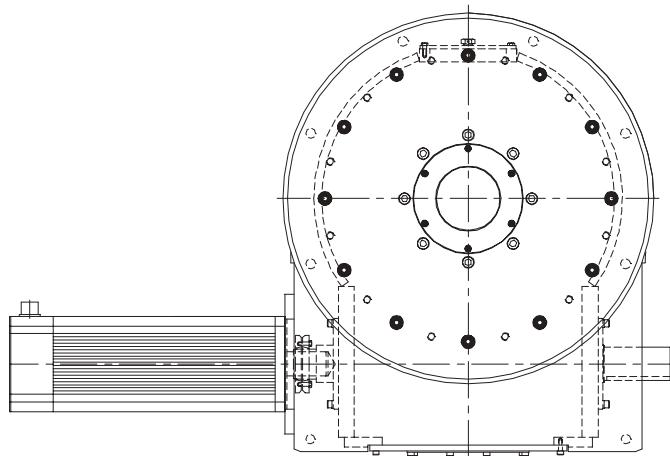

For heavy-duty applications, the E-Series drive can be supplied with a constant lead (constant ratio) cam, with or without the servo package.

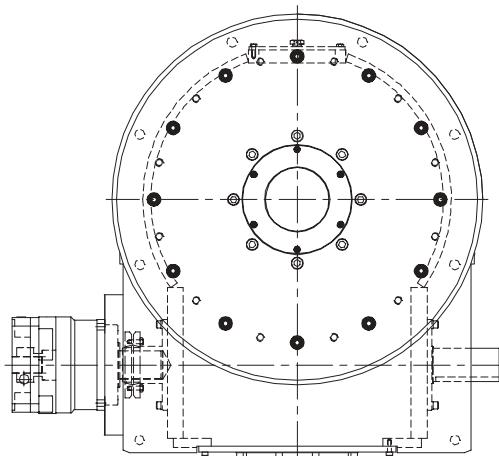

Dimensions – Servo-Driven Heavy-Duty E-Series

Model	Assembly Torque in-lb (Nm)	A Reducer or Motor Shaft Maximum Diameter in. (mm)	B Reducer or Motor Maximum Flange in. (mm)
750E	650 (73.45)	2.17 (55)	7.36 (187)
950E	650 (73.45)	2.17 (55)	6.61 (168)
1150E	1100 (124.29)	2.95 (75)	8.15 (207)
1550E	1550 (175.14)	2.95 (75)	7.24 (184)
2050E	2000 (225.99)	3.35 (85)	12.99 (330)

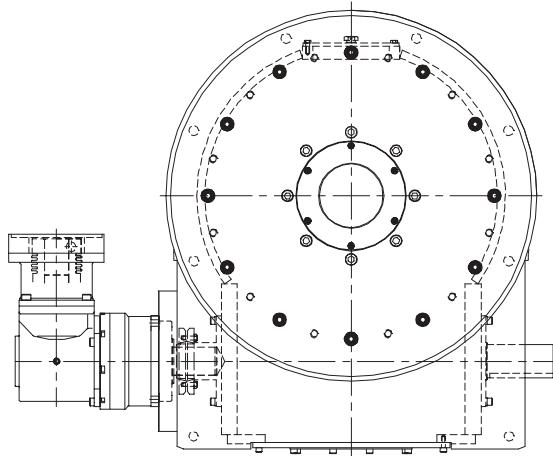

All dimensions are subject to change. For actual dimensions, please request the current drawing from IMC.
For E-Series drive dimensions see section G of this catalog.

Accessories

IMC offers a variety of accessories to complete your automation package.

- ◆ AC Inverter Duty Motors and Drives
- ◆ DC Motors and Motor Controls
- ◆ Digi-Dog Electronic Limit Switch
- ◆ Camtronics Rotary Limit Switch
- ◆ Clutch-Brakes
- ◆ Spare Parts

AC Drives

The IMC AC Inverter Drive System is a high performance, cost effective alternative to DC drives, clutch-brakes and brake motors. Positioning is achieved using a photoeye with a reaction time of less

than 1 ms. Once stopping position is set, the drive will automatically adjust for any speed differences with an extremely low margin of error. The special algorithms used in the drive make it the most accurate and dependable indexing drive for your applications.

AC Drive features include:

- ◆ Up to 60 cycles per minute (1/3 and 1 hp)
- ◆ Sophisticated inverter designed for indexing applications
- ◆ Adjustable set speed with fixed stopping position
- ◆ Tight, repeatable accuracy
- ◆ Simple, easy to use programming
- ◆ Bi-directional
- ◆ PLC/PC communication
- ◆ CE, UL conformance
- ◆ Uses standard 3 phase AC motors or low profile, high power motors designed for indexing applications
- ◆ IP20 Enclosure
- ◆ 230V single phase or 460V 3 phase

DC Drives

IMC DC Motors and Drives offer efficient, low-cost cycle-on-demand control for up to 30 cycles per minute. These motors and controls have variable speed capability for control of indexing rates and automated motor cycling for variable dwell periods. IMC's Varipak DC drive includes:

- ◆ **Current Limiting** protects the drive system from overloads and provides smooth acceleration of high inertia loads.
- ◆ **NEMA 12 Enclosure** is removable for chassis mounting
- ◆ **External Control Terminal Strip** allows for Cycle Start, Cycle Stop and Jog from Relay-PLC interface.
- ◆ **Line Regulation** – the control is unaffected by voltage fluctuations. Set speed will vary less than 1%, ensuring consistent drive system output.
- ◆ **Transient Protection** of power components against line voltage spikes with voltage clamping MOV's and RC networks.
- ◆ **Load Regulation** – 5% of base speed accuracy with armature feedback. Results in consistent machine output regardless of load conditions.

Digi-Dog

The Digi-Dog is a digitally programmable rotary limit switch based upon resolver technology and EEPROM memory. The Digi-Dog is easily programmed using the operator display. Process times and sequences can be optimized in much less time when compared to other devices. The panel mount allows debugging to occur at a safe distance from the machine. The

Digi-Dog is ideal for applications where several positions require signaling such as Parts Handlers with multiple dwells.

- ◆ LCD Displays Position, Output Status, and Setup Menus
- ◆ Easy Digital Adjustments of Outputs
- ◆ EEPROM Memory to Save Setup and Position during Power Loss
- ◆ Available with 12-Bit Single or Multi-Turn "Absolute" Resolver or 16-Bit Multi-Turn "Absolute" Resolver
- ◆ 4 or 8 Outputs (24-240 VAC or 5-60 VDC)
- ◆ 24 VDC, 120 VAC or 240 VAC Input Power
- ◆ LED Indicator Lights for Power Supply and Outputs
- ◆ Program Enable Switch to Prevent Unauthorized Programming
- ◆ Sealed NEMA 12 Enclosure
- ◆ Brad-Harrison Connector Available
- ◆ UL Listed #E-23556
- ◆ Shaft input on left or right side

Camtronics

Camtronics rotary cam limit switches have been designed for harsh industrial applications which require accurate and reliable shaft position sensing. They can be used as stand alone switching controls or as a shaft position sensor input to PLCs. The Camtronics uses a photo electric interrupter module

to sense the positions – the rotary cams pass through the module and interrupt the circuit without mechanical contact. The method provides long life, high-speed operation and eliminates contact bounce found in mechanical systems. Features include:

- ◆ Long Life
- ◆ High Speed capability
- ◆ NEMA-12 Enclosure
- ◆ 4, 8, 12 or 16 switches
- ◆ CT-4000 series
 - DC sinking outputs
 - 12-30 VDC input and 200 mA output per switch
- ◆ CT-6000 series
 - 115 VAC - does not require a power supply
 - Plug-in AC or DC modules
 - Replaceable plug-in fuses
 - LED "output on" indicator

Reducers

IMC provides a variety of drive systems for indexers. IMC Sales Representative or Applications Engineers will recommend the best drive for your application.

- ◆ **Double-Enveloping Gear Reducers** provide high load capacity, smooth operation, long life and shock resistance. They are available in ratios of 5:1 to 60:1 with double-reduction models providing greater ratios. These reducers come with NEMA "C" face motor adapters and mount directly on the input shaft of the indexer ensuring constant camshaft speed.
- ◆ **Gear Motors** with integral reducer and AC motors are available in single or 2-speed models with optional brakes for cycle-on-demand applications and recovery from e-stops.

Clutch-Brakes

IMC offers Electric and Air Clutch-Brakes for DC applications where cycle rates exceed 30 cycles per minute. A clutch-brake is mounted between the motor and reducer and allows the motor to maintain its full

RPM, eliminating the response time for motor to speed-up. With a compact, integrated design, the clutch-brake can be mounted directly between the motor and gear reducer with NEMA "C" face mounts.

Repairs and Spares

With proper maintenance, IMC products are reliable and long lasting. Occasional replacement of worn parts will keep your system running smoothly and accurately. IMC offers Spare Parts Kits for most products. These kits contain common parts including oil seals, input bearings and shims and can be supplied with additional parts such as cam followers. IMC can also repair your unit on site or it can be returned to our factory for complete inspection and replacement of worn parts. Service manuals for IMC products and accessories are available on the IMC website, www.camcoindex.com

IMC can present seminars at your plant on the proper maintenance or repair of your Camco or Ferguson equipment. In addition, IMC offers a preventive maintenance program. An IMC technician will inspect your equipment on-site and perform routine maintenance from greasing bearings to changing worn cam followers. Contact IMC at 847-459-5200 for more information.

TORQ/GARD™ Overload Clutches

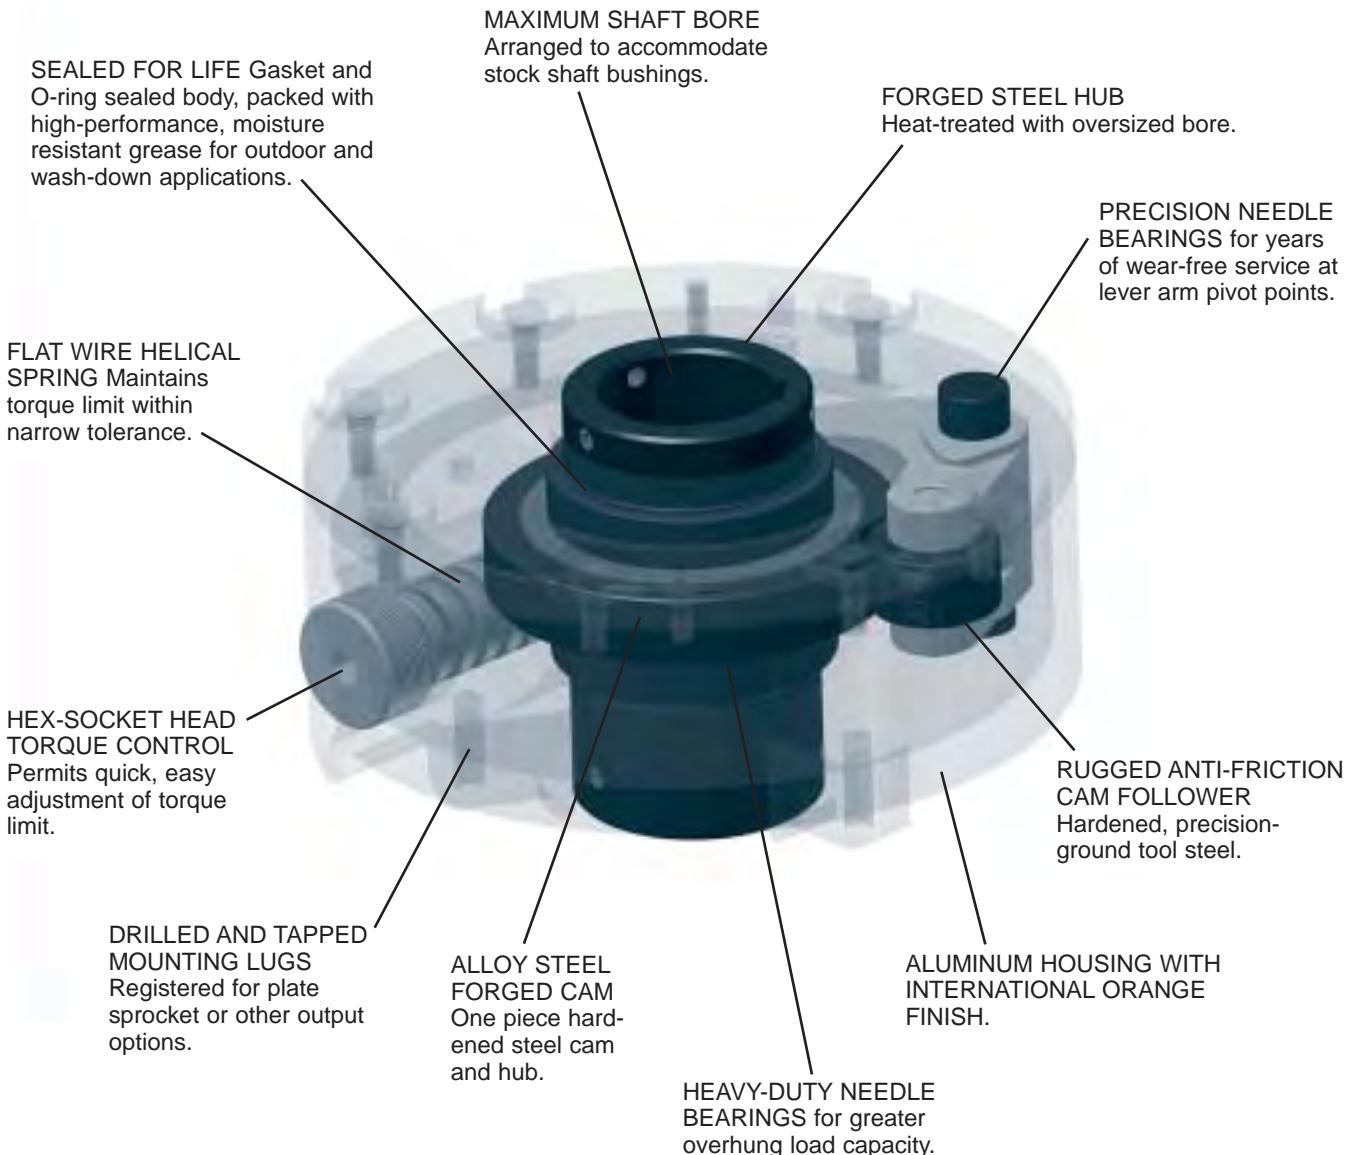

C DETECTOR
TRAVEL @ OVERLOAD

Features

IMC's Torq/Gard overload clutches help protect the entire drive train of your machinery from damage due to excessive torque generated by overloads and jamming. Instant reaction when torque exceeds preset limits provides protection far superior to that of clutches employing friction surfaces. Torq/Gard features include:

- ◆ Modular Design: one unit for direct drive, chain drive or other power transmission options
- ◆ Universal Mounting: eliminates special bore requirements
- ◆ Single Position, Automatic Reset
- ◆ Reversible
- ◆ Torque Repeatability

Torq/Gard™ Features

Torq/Gard™ Sizing and Selection

Torq/Gard overload clutches are available in seven sizes with capacities trip torques from 13 in-lbs to 8000 in-lbs.

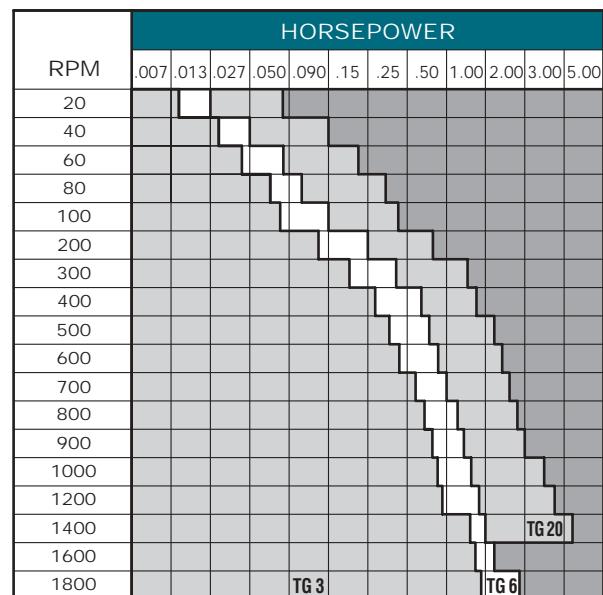

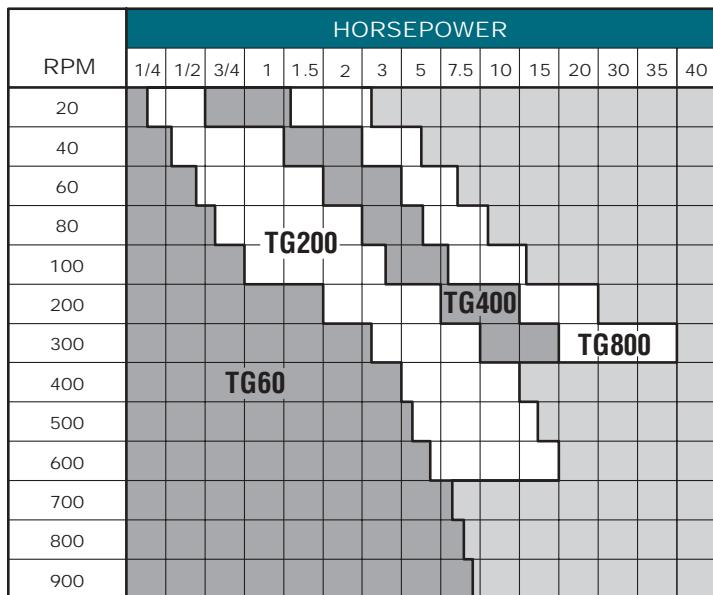

Torq/Gard Clutches may be sized using the Speed-Horsepower Chart, the Speed-Torque Chart and these formulas:

$$\text{Torque (in-lb)} = \text{Horsepower (hp)} \times 63025 / \text{RPM}$$

$$\text{Horsepower (hp)} = \text{Torque (in-lbs)} \times \text{RPM} / 63025$$

$$\text{Tripping Torque (in-lbs)} = \text{Operating Torque} \times \text{Service Factor}$$

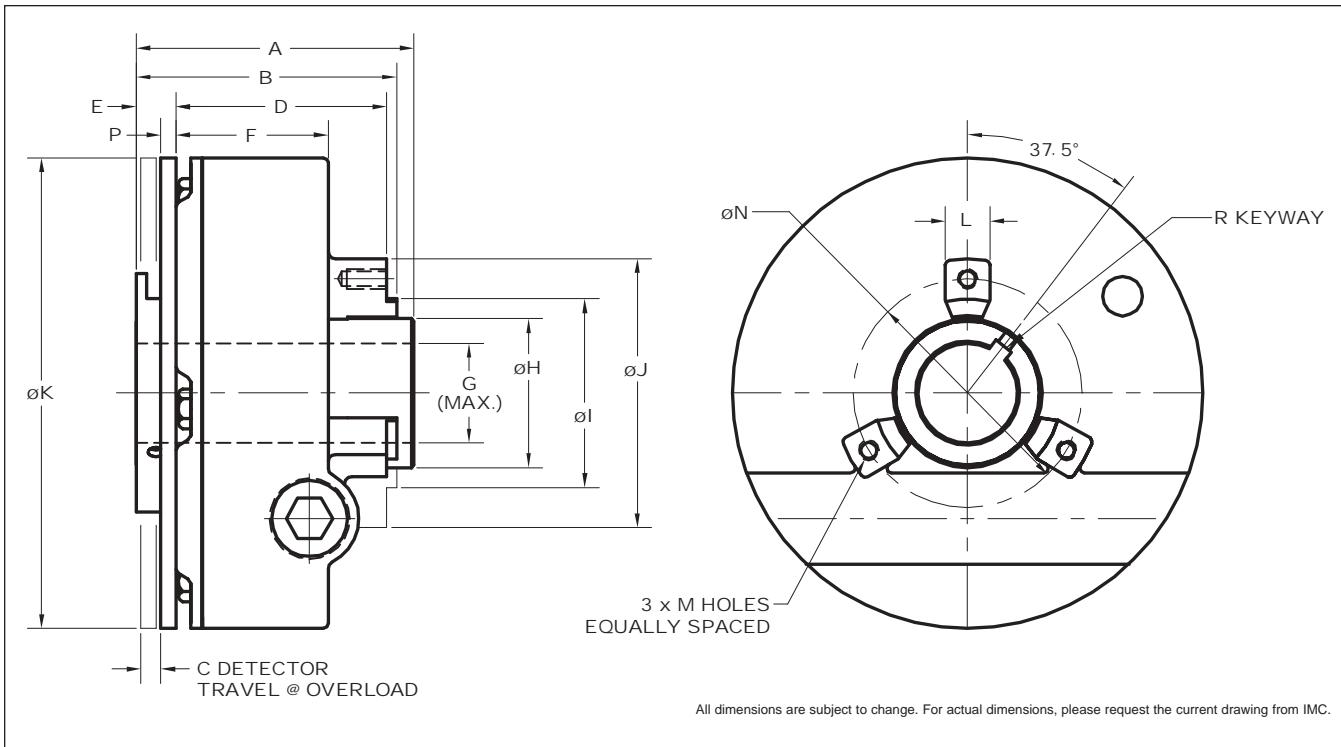

SPEED/HORSEPOWER CHART

Torq/Gard™ Application Considerations

The Torq/Gard should be used on the low speed side of a speed reducer in several ways:

- ◆ **Direct Drive:** The Torq/Gard can be mounted on the speed reducer output (low speed) shaft and directly connected to the driven machine using a Browning Ever-Flex half coupling and the Universal Adapter Plate.
- ◆ **Chain Drive – Mounted on Speed Reducer Output:** Mounting the Torq/Gard on the output of the gear motor or speed reducer with a roller chain connection to the driven machine provides the most economical clutch assembly. The Torq/Gard is designed to protect the weakest link in the drive system.

◆ **Chain Drive – Mounted on Driven Machine:** Mounting the Torq/Gard on the driven machine and powered through a chain and sprocket drive tends to absorb peak starting torques.

◆ **The Torq/Gard should never be used on the high speed side of a reducer.** Clutch sensitivity becomes a function of the reducer's gear ratio. As an example, when used with a 100:1 reducer, a 100 in-lb torque variation on the output side of the reducer will reflect only a 1 in-lb change on the input side. Do not exceed the maximum RPM shown in the Torq/Gard selection tables.

Custom Applications

Industrial Motion Control provides expertise to customize Camco and Ferguson products for your applications including:

- ◆ Custom Cam manufacturing in a wide variety of sizes, materials and configurations
- ◆ Custom Cam design engineering
- ◆ Customization of IMC products or integration of IMC products with each other
- ◆ Custom Components: Cam and Followers Wheel supplied "without the box"

Custom Cams

IMC Custom Cams serve as an economical alternative to "in house" cam design, engineering and manufacturing. Backed by over 100 years of experience, we offer cams in a comprehensive range of configurations, tolerances and materials.

Our designers employ the most advanced computer technology available for detailed kinematic studies and dynamic analysis. In addition to common dimensional inspection, we perform computerized contour measurements with sophisticated, unique inspection equipment in both 2D and 3D.

Our commitment to applied engineering allows us to respond quickly to complicated manufacturing issues with specialized solutions that are precise, economical and engineered to your exacting specifications. Alternative materials, milling, and grinding techniques are explored to provide the best solution for your application at the most economical price.

To assist in your in-house cam design, you can download Clyde H. Moon's "Cam Design Manual for Engineers, Designers, and Draftsman" from the IMC website, www.camcoindex.com.

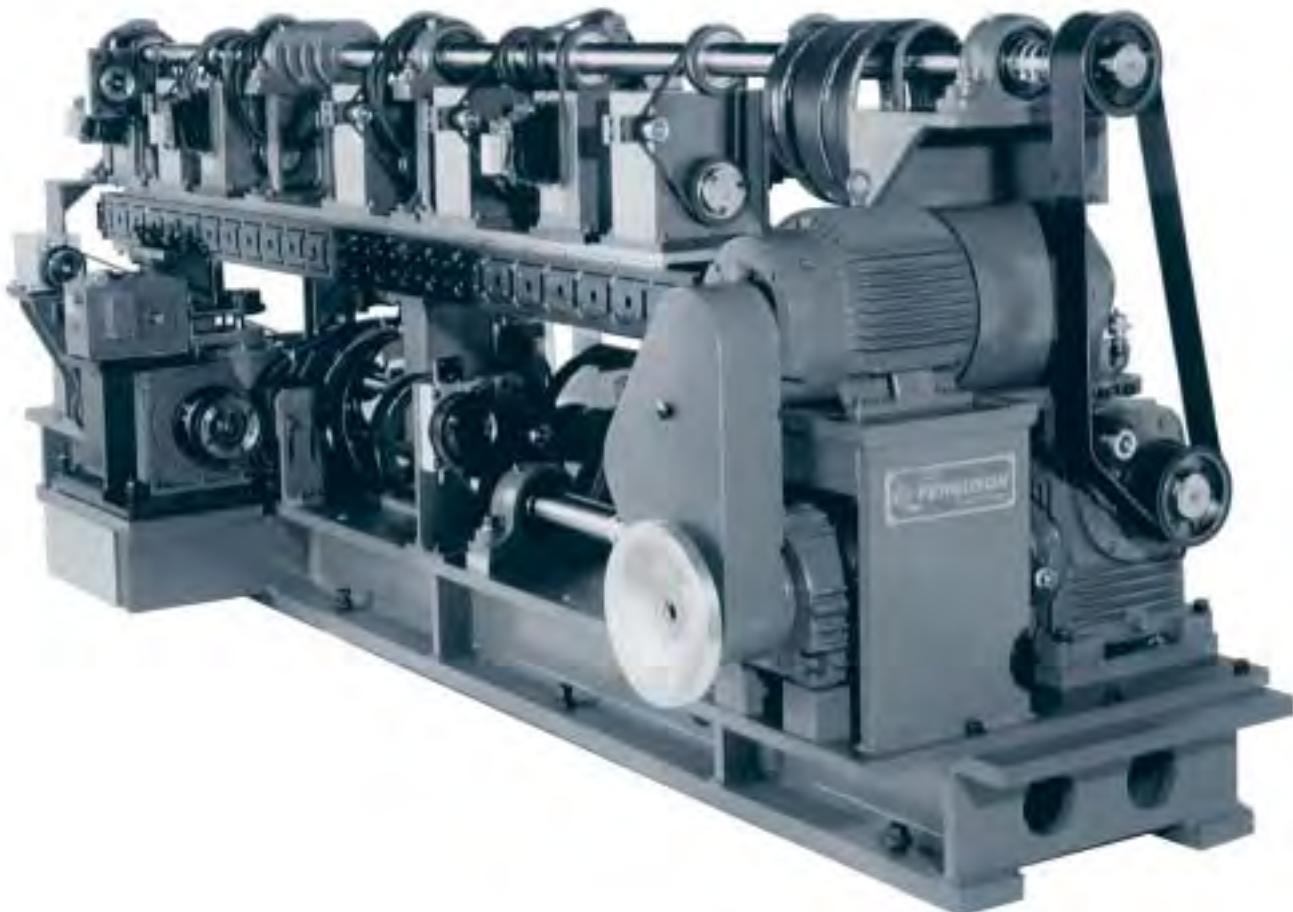

Custom Cams are available in a variety of styles:

Plate Cams Popular, economical design used in low speed applications.	
Globoidal Cams Complex, tapered rib globoidal cams, commonly known as roller gear cams, are the heart of IMC's indexers. Controlled follower preloads increase follower life, speeds and accuracy for the ultimate solution in motion control.	
Face-Grooved Cams Medium speed cams using a groove slightly larger than the follower diameter providing minimal running clearance and reduced backlash.	
Conjugate Cams Dual cams controlling preloaded followers which provide higher speed capabilities and better accuracy.	
Barrel Cams Cylindrical cams which can be provided as an end cam, grooved type with minimal follower clearance or as a ribbed type utilizing preloaded followers for increased life and accuracy.	

Custom Machinery

IMC will work with your engineers to customize our products to your application including:

- ◆ Index Drives with Custom Motions
 - Oscillating
 - Matched Velocity
 - ◆ Custom Dimensions
 - Extended Shafts
 - Special Mounting Hole Patterns
- ◆ Integration of IMC products such as Parts Handlers combined with Conveyor on a common base
- ◆ Custom Components: Cam and Follower wheel supplied “without the box”

A DOVER COMPANY

PRECISELY POSITIONING OUR CUSTOMERS FOR PRODUCTIVITY.

Workholding

- Widest variety of workholding products
- High durability and reliability
- Flexible solutions for all applications
- Custom products for unique requirements

Automation

- Broad range of engineered automation products
- Complementary products for modular integration
- Unmatched accuracy, reliability and performance
- Unparalleled global sales, service and engineering support
